A Scenic Mining District.

Central Idaho is typical of many localities that possess attractive, charming scenery that would have remained inaccessible, if not, indeed, unknown, but for the discovery of dormant resources of mineral wealth.

The illustrations on this page and on page 4 are glimpses of a scenic paradise in the heart of a rich mining region just beginning to yield to mining exploitation. The Seven Devils country and the basin of Salmon river are rugged and mountainous enough, are sufficiently remote from settlement and sufficiently devoid of all the natural facilities for mining to satisfy the most exacting of the old prospectors that it is a good country to prospect in, a good country for good mines. So it has been during the past few years, since the advancing fringe of settlement pushed the pioneer prospectors forward into it. Buffalo Hump and Seven Devils have been discoveries from which prospectors drew down good rewards for pioneering an attractive wilderness.

Now that the way is broken and roads built by the miners, the country is found to have additional possibilities of wealth production from grand natural scenic attractions. Hotels and summer homes, and the facilities that attend on social life will in turn aid to the more complete discovery and exploitation of the mineral wealth hidden beneath the scenery.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Payette Lakes, Boise Co., Idaho; Crossing the Middle Fork of Salmon River, Idaho; Snake River Below Ballards Landing, Seven Devils, Idaho, 1. Moon Lake, Thunder Mountain, Idaho, 4. Portable Belt Conveyors; Mining and Metallurgical Patents, 7.

EDITORIAL.—A Scenic Mining District, 1. Suggesting a Change in the U. S. Mining Statutes; Prospect of Work on Restraining Barriers in the Yuba River; A Lead Mining Combination; Royalty on Klondike Gold, 2.

MINING SUMMARY.—8-9-10.

LATEST MARKET REPORTS.—10.

MISCELLANEOUS.—Concentrates, 3. The Seven Devils, Idaho; Genesis of Ore Deposits, 4. Smelting of Siliceous Lead-Copper Ores (Carbonates) at Llano, Sonora, Mexico, 5. The Formation of Bonanzas in the Upper Portions of Gold Veins, 6. Portable Belt Conveyors; Mining and Metallurgical Patents, 7. Personal; Recently Declared Mining Dividends; New Patents; Notices of Recent Patents; Commercial Paragraphs; Catalogues Received, 10.

In suggesting to the Mining Congress, which meets this month at Boise, the desirability of action toward securing such a change in the U. S. Mining Statutes that subsequent lode locations shall not have extralateral rights, this paper believes that there is no reason to the contrary in the fact that such rights have been vested in all existing locations and in existing mining patents. It is recognized that these vested rights cannot be altered nor can their claimants be dispossessed of them. But it is submitted that all the possible mines in the public lands of the United States have not been discovered and have not been located. It is to protect the discoverers of these from the perpetual threat of litigation and the costs of protection from it. As the law is now, locations of claims are made that do not cover the apex of lodes or conform to the plain intent of the law. They are made to secure such an area of surface ground that there shall remain nothing vacant that can be located as the basis of a blackmailing suit. The use of such opportunities is openly recognized by the location of fractions that have no value as mines, but can be used for blackmail of bona fide mining. The change in the law will destroy the possibility of such blackmail attacks on future locations and minimize the possibilities on existing mines.

AFTER twenty years of persistent effort and agitation there is at the present time a measurably near-by prospect of work being begun on mining debris restraining barriers in the Yuba river in California. The Government officials coming in contact with the problem have finally grasped the fact which makes the construction of such restraining works a necessity. They now see that it is not simply a matter of providing for the storage of debris from continued mining, the restoration of the hydraulic mining industry, but is more importantly the holding back in the mountains of the vast mass of mining debris deposited in the mountain canyons from the mining of the thirty years prior to 1880. This vital fact of necessity was just as much in evidence in 1880 as it is now, and acted on then as it is proposed to now, restraining works would have prevented much damage that has been done in the interval and much that cannot now be prevented by the present construction of works. During the twenty years fully two-thirds of the accumulated mass of debris in 1880 above the proposed site of restraining works is now below the site. The works would have cost no more then than now and they would have held this mass back and saved their cost in the interval. Incidentally there would have been an enormous output of gold from the hydraulic industry that has been closed

down in the interval. It is to be hoped that now that the Government officially knows the urgency and necessity of the debris restraining works that construction will be hastened and extended. There is debris in other rivers that should not be permitted to work below the possible sites of restraining works.

A Lead Mining Combination.

In continuation of the logical development of consolidation following on the formation of the American Smelting & Refining Co., the telegraph reports the organization in New York of a lead combination, capitalized at \$20,000,000, to control the output of the lead mines in Missouri. Among the properties mentioned as included are the Guggenheim Exploration Co., the Standard Oil lead mines, the Whitney-Ryan holdings, the Union Lead & Oil Co., the Electric Storage Battery Co. and the Grant B. Schley mines. The different interests are to be consolidated into one company, to be managed by the Guggenheim Exploration Co. of New Jersey. It is stated the new company will construct smelters, concentrators and refineries adjacent to the various properties.

The Missouri lead mines are producers of lead ores at very low costs. The value of the ore is practically all in lead, the silver content being low. Still the low costs of mining and low transportation charges make them safely profit-earning with a market price for lead so low that it would close down many lead-silver mines in Colorado or Idaho. The properties named as going in the combination are only a minor fraction of the total mines, but aggregated and in control of the smelting, transportation, marketing and consuming agencies the combination will be a dominating fraction.

The significance of the interests mentioned is in their visible identity with the interests that constitute the American Smelting & Refining Co., the smelter trust. It shows as actually occurring what this paper predicted three months since would be inevitable. The smelter combination is owning the mines. The difference between ownership and business control is in this latest reported action a difference of name with no difference of fact. The ownership so far developed is of the mines capable of producing the cheapest metal at the point of consumption. It is notable that the declared policy of the new combination is to still further reduce the costs at the point of consumption by the building of smelting and refining works at the mines. By so doing the lead is not charged with the cost of transportation of gangue. It is significant also that large consumers of raw material are included in the combination. The new organization proposes to control lead from the mine through all intermediate stages to the finished consumable product. Such production can not but be economical.

The new combination is a business recognition of the real position of lead as stated by this paper. The situation it develops for the lead-silver miners of the Rocky mountains is not encouraging to a continuance of the industry under the conditions of the last few years. They are in the position of having to sell their ore productions to a competing mining organization endeavoring to maintain profits in the face of lower sale prices. The Missouri lead production must have the profit that was the incentive to combination, if it has to take it from the silver-lead miners of the Rocky mountains.

The means adopted to secure these profits are commercial, and it must be recognized that they represent the most perfect art of business exploitation of an industry. The lead smelting agencies, to secure the profits, have become miners of lead in Missouri. The lead-silver miners must become smelters of lead in the Rocky mountains if they would continue to hold the profits the others are proposing to take.

THERE does not appear to be any hurry on the part of capital to take advantage of the Canadian bounty on lead refining. With all due allowance for reasonable conservatism of action with reference to large undertakings, there seems a reluctance to take the risk involved with lead in its present commercial position despite the bounty of \$5 a ton. It would appear as if the bounty was not regarded as an insurance of profit for the business.

Royalty on Klondike Gold.

The Yukon Council is in receipt of some more advice as to how not to do it in the collecting of the royalty, some of which is believed to escape. Mr. F. T. Congdon, the legal adviser of the Council, has suggested to it that the Government establish a purchasing office and compel all mine owners to sell their gold dust to the office. Details are provisions permitting laborers to file liens for disputed wages claims against the gold in the hands of the purchasing official, who will then hold it pending the operation of the court on the lien; providing that the miner could not receive pay (less royalty) for his gold till ten days had elapsed to give the laborer his chance; inspectors would be maintained at the mines to see that the product of the claims was all turned in, and other inspectors at the boundaries would enforce the turning in of any gold that escaped the other set. The export of gold dust would be prohibited except by the Government, and payment would be made in Canadian money, which makes another shave.

The idea may be new to its proponent, but it is so singularly like the Russian law controlling the same matter that it is old to other people. In Russia gold must be sold only to the Government, which takes out its royalty and pays for it in paper roubles. Government mining engineers are kept at the mines, who receive the gold and forward it to Irkutsk, where it is bought and then paid for. The differences are in names only, the essentials are identical. In Russia, Chinese gold buyers give spot cash for gold and pay a higher price than the Government. As a consequence they get large amounts, which they smuggle into China. The Russian Government does not pay its mining engineers very large salaries.

Something more modern is looked for from Canada than the copying of Russian administrative methods. That the regulations described are seriously proposed cannot be ascribed to ignorance of a business way of accomplishing the desired result. What is wanted by the Canadian Government is that the gold mining industry should contribute enough gold (5% of the total is considered sufficient) to pay for the government of the people dependent on the business and the cost of collection. What the gold miners want is to pay as little of the gold as possible. The proposition of Mr. Congdon is to increase the cost of collection and provide additional motives to miners to evade the law altogether by increasing the premium for successful dishonesty.

Precisely the opposite way is the desirable way of proceeding. Instead of increasing the cost of collection, decrease it. Abolish "royalty" as such altogether. Establish either a mint or a government assay office, and make the charges of melting, assaying and officially stamping the gold bars 5% or a less per cent. It is probable that with the costs of collection of the royalty deducted that the other governmental requirements of taxation could be met with 4%.

The advantages to the miner which would induce him to bring his gold in to the assay office would be: (1) He would save the commercial shave that is made by trade payment for gold dust by the stores at about \$1 less an ounce than its coinage value. This shave ranges from 3% to 6% dependent on the success of the merchant in avoiding being defrauded in the buying by wilful impairment of quality. (2) The assay office bars would become worth their coinage value less refining charges on which no advantage could be maintained by local merchant buyers. (3) The miner when he gets his gold dust to Seattle has to pay 1% to 1½% for assaying and melting, so is out nothing by having it done at Dawson, but in fact saves the delay of waiting for the assay returns. His gold is salable at once on the assayer's stamp. (4) His metal is more safely and cheaply transported in bars than as dust.

It will be noted that by giving something in return for the royalty the Yukon Council, or rather the Canadian Government, will so reduce the profit of successful dishonesty that it will no longer overbalance the risk of loss from being caught.

THE reports of dividend payments made during the first six months of 1901 indicate that mining, including the separate smelting and treatment operations dependent on it, is the most profitable of all the industries.

Concentrates.

GOLD, silver and copper have the same hardness as calcspar.

WHERE combination is possible, competition is impossible.

THERE is no advantage gained by increasing the width of a belt to prevent its slipping on the pulleys.

NEW COPPER PLATES will absorb gold at about the rate of one-half pennyweight to each ton of ore milled.

A THIN coating of scale on the wet side of a boiler plate affects the steaming capacity less than a furring of soot on the fireside.

THE No. 5 shaft at the Tamarack, Mich., copper mine is over 4900 feet deep and cost \$633,598, or about \$130 per foot, including the surface equipment.

LOCATORS AND OWNERS of unpatented mining claims on forest reservation lands must get a permit to cut timber on the mining claims for mining use.

IN California a miner's inch of water is defined by statute to be equivalent to $1\frac{1}{4}$ cubic feet of water per minute, measured through any aperture or orifice.

FOR burning in its crude state, oil should be of a gravity of about 14 to insure the best results, there being more heat units in such oil than in the lighter grades.

THE State of Colorado produced in gold and silver in 1900 coinage values of \$41,250,811, which gives it the first place in comparison with other States and foreign countries.

THE latest report of the Anaconda M. Co., Butte, Mont., states the cost for mining during the year 1900 was \$3.97 a ton, and for smelting, refining and treatment charges generally \$4.14 a ton.

A LARGE BOILER will make more steam per pound of fuel than a small one, but there is a limit, and the interest on the extra cost of the large boiler can exceed the extra cost of fuel and maintenance of the small boiler.

THE Cariboo Con. Hy. M. Co. has sent a gold brick, weighing 1000 pounds and containing approximately \$200,000, to the Glasgow Exposition. It is the cleanup of the first run of the season at the mine at Bullion, B. C.

CHILE produces about 25,000 tons copper annually. The most of the ore is exported, and the Chilean copper plants are mostly idle. Inadequate transportation is the chief cause of the depression there of the copper industry.

A BOILER 48 inches diameter, 14 feet long, 50 3-inch tubes, contains 677 square feet effective heating surface. The grates might be 4 feet 8 inches wide by 3 feet 6 inches deep; the boiler would be about 60 indicated horse power.

QUARTZ ground to pass through No. 30 screen will weigh ninety-nine pounds to the cubic foot; ground to pass No. 60 screen, ninety-eight pounds to the cubic foot; ground to pass No. 100 screen, ninety-four pounds to the cubic foot.

THE claim is made that there is possible a considerable economy in operating the separate machines of a sawmill with electric motors, over the use of shaft-transmitted power, even if it is steam-driven from power developed on the premises.

CONCRETE is coming into use in mining on the European continent, mostly in the form of slag cement in shaft linings. The cost is about \$1.75 per cubic yard. The slag cement is made up of 75% granulated slag and 25% slaked lime.

THE insulating qualities of mica, used so extensively in electrical instruments, are materially affected by contact with oil. A sheet of mica spread over a thin layer of oil loses nearly one-half its normal resistance to the passage of an electric current.

WHILE a water right cannot be patented as such, a placer claim can be taken up covering the site, and this patented. That title will not preserve the water right, but will protect the site from forcible invasion while the water right is actually used.

THE largest ore crusher known to "Concentrates" is at the Bewabik iron mine, in the Mesabi range, Minnesota. Its capacity is 500 tons per hour. It weighs eighty tons, and stands 20 feet high to the top of the hopper. A 150 H. P. engine drives it.

IN a comparison between milling costs of ores in different mines the nature of the ore is the controlling element. This must be taken into account or the comparison has no instruction value. Very slight differences in nature make wide differences in costs.

FOR a turbine water wheel the forebay leading to the flume should be constructed sufficiently wide and deep to allow the water to pass to the wheel at a velocity not exceeding one and one-half feet a second. And there should be no abrupt turn to break the water into eddies.

THE nominal steam power of a boiler is ordinarily considered as 34.5 pounds of water evaporated from 212° per H. P., and under average circumstances this requires about 10 square feet of heating surface. This last depends largely on the character and cost of the fuel employed.

THE new process of making cement, the invention of Thomas Edison, is expected with a plant of 1500 barrels capacity daily to result in a cost of 80 cents a barrel, and 45 cents a barrel when a daily production of 4500 barrels is made. Also a further reduction of cost to 28 cents a

barrel is anticipated when manufacturing 10,000 barrels daily. The present selling price in large quantities at Eastern works is from \$1.15 to \$1.30 a barrel.

THE United States Geologic Survey has an exploring party in northern Alaska headed by W. C. Mendenhall, geologist, and D. L. Reaburn, topographer. They will explore northward from the Koyukuk river to Kotzebue sound. It is a country that is practically unknown.

THE occurrence of explosive gas in metalliferous mines is very rare, but there are instances, on record at Penzance, Cornwall, where in tin and lead mines the rock, when freshly cut, gave off volumes of gas. It has also been noted in opening up old levels that have long lain under water.

THE United States branch mint at San Francisco has just completed the largest single year's coinage of any mint in the world. The output for the year ending June 30, 1901, is \$80,211,426, of which \$74,482,500 is gold. The highest previous coinage of any mint was the 1881 coinage of the Philadelphia mint, \$76,000,000.

THE market for chrome iron ore has not increased very largely during the last few years. Its use in steel making, a certain proportion hardening and toughening the steel and making it especially desirable for special uses. It is also used in the preparation of pigments and chemicals. There is no market for the ore on the Pacific coast.

THE lowering in the rate of interest earning on capital accepted has been the controlling factor in many improvements in efficiency of engines and machinery. This reduction has made possible large capital investment for relatively small savings of waste. The interest and maintenance charges on this investment are less than the money saving of the waste.

THE British Government is considering a proposition to supply a large manufacturing area with fuel gas manufactured from coal by the cheap Mond process, at the rate of 4 cents per 1000 feet. It is estimated that the coal saving effected by the change will be four tons out of five. That is, one ton of coal made into gas, will do the work of five tons of coal as now used.

THE discovery of mineral on land that is patented does not require location. A vein apexing in patented land, unless it is a lode mine patent, gives no extralateral rights to the owners. It is impossible that there should be any extralateral rights, as there is no law under which they can be initiated. Location as a lode mining claim is an essential condition precedent to extralateral rights.

ANY of the location lines of a lode claim may, if established openly and peaceably, be laid within, upon or across the surface of patented lode mining claims for the purpose of embracing and including the discovery vein and all other veins apexing within the free and unappropriated ground within such location lines, and the ground itself as well, and of defining and securing extralateral underground rights upon all such veins.

THE new Arizona mining law requires in that Territory that locators of mining claims shall put up seven monuments, three at each end of the claim and one at the discovery shaft. The claim can be recorded as soon as located, but the location work can be performed at any time during ninety days after the location is made. The law goes into effect September 1st, 1901. The fee for recording claims, and affidavit of location work, is one dollar.

THE Supreme Court of Texas has decided that minerals found on school lands that the State has sold belong to the purchasers. The decision is of particular importance since the discovery of petroleum, and also calls attention to the different status of Texas school lands from those of other States. The latter all acquired their school lands by grant from the United States, but Texas has the original title to all her lands, and the decision of her own Supreme Court is final.

THE export of lumber from Alaska is not permitted by law. In manufactured form, as boxes or furniture, it can be exported. There are no surveys on which title to timber lands can be obtained. At the present time the Government charges 10 cents a thousand feet stampage, which is paid by the sawmill. All of southeastern Alaska is heavily timbered. Very large trees are not uncommon. The varieties include yellow and red cedar, spruce and fir. There is no pine.

TESTS have been made at the Puget Sound Naval Station, Bremerton, Wash., of woods for naval use. The samples were pieces 3 feet long and 4 inches square. In the three transverse tests Puget sound fir broke at 9060 pounds strain, 8310 pounds strain and 9040 pounds strain. Texas yellow pine broke at 10,660 pounds, 8310 pounds and 7640 pounds strain, respectively. In tensile tests on a spindle 1 inch in diameter the fir tests were 19,200 pounds, 18,200 pounds and 17,000 pounds strain before the fiber pulled out. The best sample of Texas yellow pine only stood 11,000 pounds strain before giving way.

IT is sometimes the case that gas engines have air inlets too small and compression spaces too large for satisfactory work in a rarefied atmosphere. When a gas engine is intended for high altitudes it should have a larger air inlet and a smaller compression space than when the same engine is to work at sea level. For altitudes of more than 5000 feet the engine should have a plate attached either to the piston or to the cylinder

head, in order to reduce the compression space. Gasoline at high altitudes evaporates at a much lower temperature than at the sea level, and it is well, therefore, to use the heavier grades at high altitudes.

WHEN rating mineral as manganese ores or as maniferous iron ores, the distinction generally accepted is made on a content of 44% manganese, i. e., ores which when dried at 212° contain 44% or more of manganese being classed as manganese ores, and those carrying smaller percentages rated as maniferous iron ores unless they have less than 3% of iron. Treasury decision 4114 orders that ore to be classed as manganese ore must contain 50% or over of manganese and not over 10% of iron; but treasury decision 16,550 allows certain ore containing less than 50% of manganese to be classed as manganese ore when the iron contained was less than 3%.

PURE feed water has an injurious effect on boiler plates. The return water from the condensers is pure water, that is, distilled water. If some kind of chemical is not introduced into the boiler with this kind of feed water, in order to neutralize this effect, it will surely pit and corrode the plates, especially in the vicinity of the mud drum. Zinc is often used in boilers and hot water tanks to prevent the corrosive action of the water on the metal of which the boiler is composed. The action is electro-chemical. Some of the water is decomposed and the hydrogen goes to the iron shell, reducing any rust that may be formed and depositing the iron on the shell. The oxygen goes to the zinc, forming zinc oxide and gradually wasting the zinc away. A boiler should be kept clean of soot. The acids in it have a more injurious effect than scale on the metal, and the presence of soot means waste of fuel.

FLOURING of quicksilver is not precisely the same thing as "sickening" of quicksilver in amalgamation. Under agitation, and particularly under agitation with solid substances, mercury breaks up into minute globules, and this is aimed at in feeding quick to a battery in order to thoroughly distribute it among the ore. Each particle is surrounded by a film of air or water, as the case may be, which, broken, the metal globules readily run together again if there is no contamination and if the particles are not so fine that the effect of gravity is destroyed and they float off. But if contamination takes place and a foul coating of grease or some of the talcose soapy earths so often present in ore gets on the particles the mercury is then in the condition termed "sickened" and it will not amalgamate the metal in the ore. Mere flouring of the quicksilver is, however, not in itself necessarily deleterious.

THE base of all clays is kaolin, which consists of alumina, silica and water combined, chemically. It is a decomposition product of some of the feldspars in granitic rocks. It can be recognized by its soapy feel and its earthy odor when breathed on. Heated, it gives off water, and heated before the blowpipe with nitrate of cobalt it turns blue. This kaolin mixed with different foreign minerals is known as fire clay, brick clay, potters' clay or by the names of minor subdivisions of these. Free silica is a very common constituent; so also are ferric oxide, magnesia and organic matters. Other minerals such as quartz, feldspar, mica, limonite and magnetite are impurities, which in large quantities impair the quality for many manufacturing uses. As a rule, the highly plastic clays are not highly refractory. Flint fire clay, which is one of the most refractory clays, is almost devoid of plasticity.

THE alternator of ten years ago, with its high-speed armature, with a surface winding held in place by band wires, is hardly recognizable as belonging to the same class of apparatus as the modern engine-type alternator. Belt and pulley have been discarded and the engine supplies the shaft and bearings. In many large machines the revolving armature has given place to a revolving field, which is constructed to have mechanical safety comparable with that of a flywheel, and, indeed, to perform the mechanical functions of a flywheel, thereby placing the flywheel precisely where it is required, without the strains which would otherwise come upon an intervening shaft. The stationary armature winding is laid in grooves or slots; it is not the hand winding of '91, but a succession of coils wound to exact dimensions on a lathe and insulated before being put in place, or else a succession of straight bars which can be shoved endwise into partially closed slots and joined at the ends by connectors of copper strap.

IN buying a boiler, it is necessary to note height of shell above the grates and the inclination of the grates, if they are to be inclined. The level of the boiler-room floor is usually fixed by apparatus other than the boilers and its relation to the floors of other departments. It is usually more convenient to make changes in the boiler fronts and setting than in the floor levels. When the grates are to be inclined at any angle corresponding to not more than 3 inches in the length of the grates, no such changes will be necessary; for a greater inclination the height of the grates at the front, measured from the level of the boiler-room floor, should be reduced. When the grates are to be level, or when inclined at an angle corresponding to 3 inches in their length, the height from the floor level to the front end of the grates should be from 26 to 28 inches. When the rear end of the grates are depressed a distance equal to one-fourth the length, the height of the front end above the floor level would not exceed 26 inches, and with a ratio of 1 to 3, would not exceed 24 inches.

The Seven Devils, Idaho.

STAFF CORRESPONDENCE.

That mountainous group of peaks and spurs in the northern portion of Washington county and the southern part of Idaho county is known as the Seven Devils. They trend from the northwest to the southeast, their crests being about 8 miles east of the Snake river. The main peaks reach an altitude of 8000 feet, the bed of the Snake river at that point being 1800 feet. It is asserted by some that the Seven Devils properly form the southwestern terminus of the Buffalo Hump, Sawtooth and Florence ranges of the Salmon river section. On the northeast side of the Devils range is Black lake and the headwaters of Rapid creek, which flows northeastward into the Little Salmon. In the same locality are the headwaters of Deep, Granite, Indian and Bear creeks, all flowing westward into the Snake. The most important of these are Deep creek and Indian creek, about 7 miles apart in their middle course, and between which is a secondary spur called White Monument mountain that embraces the copper belt which is the basis of present operations that pertain to copper mining. This copper zone, traceable from Indian creek to Deep creek, having a strike from southeast to northwest, is along the contact between diorite and porphyry. The contact material forms dikes of lime in places. The ore is carried in a gangue composed of iron garnet, silicates of alumina, iron and lime and specular iron. A considerable area of this belt is heavily timbered and the outcroppings are not readily discovered, but in the opinion of some there are two parallel contacts at the surface which may come together at greater depth. From the west contact westward toward the Snake river is a porphyry formation; from the east contact toward the Little Salmon is a diorite and granite. Along both contacts and between them are lenses of limestone. The ores comprise the blue and green copper carbonates, bornites and chalcocite. There is not much chalcopyrite at present developed depths.

The ore shoots, which trend usually in the same general direction, are considerably broken up, irregular and frequently cut off by horses of lime or diorite. The generally accepted theory is that these shoots of ore at greater depth may become more regular and concentrated and the ores more of a chalcopyrite. The point of initial discovery was on the old Peacock claim, at the northern end of the belt, facing Deep creek, and almost in sight of Snake river canyon. This location was made over twenty years ago. Present work shows a face of ore in an open cut and some similar ore is disclosed by a shaft and tunnel. South of this several hundred feet is the South Peacock, having a shaft to considerable depth which shows ledge matter, but small values. Following southward on the same general zone there are contiguous holdings for 7 miles to the bed of Indian creek.

The Boston & Seven Devils Copper Co. own the Decorah, Arkansas and Helena groups, on the slope facing Indian creek, and the White Monument near the summit; the same company has a bond and lease on the Old Peacock, South Peacock, Copper Key and others toward the north end of the belt. There is a good surface showing of copper on all these and on the Helena there are several hundred feet of work consisting of drifts in ore on three different tunnel levels. The result here is a considerable tonnage of high-grade ore ready for shipment. This company, besides working a force of men on the Decorah and Helena, on the south end, and a similar force on the Peacock group, are doing some important work with the diamond drill at both ends of the line, with the idea of making determinations as to future work on a larger scale.

The Blue Jacket group, which joins the Helena on the northwest, comprises four claims which are held under bond and lease by the Blue Jacket Con. Copper Co., of which F. J. French is manager. On this property a main tunnel goes in 900 feet, giving a depth on the vein of 350 feet. A shaft which is being sunk to intersect the tunnel is to be sunk 320 feet below the tunnel level. Shipments amounting to fifty carloads of ore were made from this property in 1900, which is said to have averaged 40% copper and brought \$25,000. The ore shipped was mainly bornite and came from above the 60-foot level. Other shipments of 150 tons were made which ran 27% copper. These ores, especially the bornites, carry about eight ounces silver and \$15 gold to the ton. The Blue Jacket is to be provided with new boilers, hoisting engines and pumps. It is also announced that a small matte smelting plant will be erected this season.

Northwest of the Blue Jacket, extending to the saddle between the Indian and Deep creeks, is the Lockwood and Sampson groups, containing good surface showings of copper, but which are not being vigorously developed. This group is important, however, as such development as it has shows a continuity of the ore belt through the mountain from one slope to the other. This belongs to A. M. Gray, who was the original locator of the Blue Jacket. E. D. Ford and T. G. Jones have located groups of claims

in the locality of the Decorah; and A. M. Tousley has for years held a group between the Peacock and Lockwood near the summit, and the small amount of development on the latter discloses the same character of copper ores as are described above. F. Alers and associates have located a group of eight claims 6 miles northwesterly from the Old Peacock, called the Red Ledge group. This is in the same general course taken by the main belt and has good surface indications of bornite ore. On the eastern slope of White Monument spur are similar copper disclosures

river, 10 miles west of Cuprum. It is operating with a small force. The Iron Dike mine is also a copper property on the Oregon side, near Ballard's Landing, but which is not operating at present.

Kleinschmidt Bros. of Helena, Montana, own the controlling interest in the Peacock, Blue Jacket and others, and have spent considerable money in the district on roads and other development. Their interest in the Blue Jacket is bonded to the Blue Jacket Con. Copper Co. of New York, and the latter are working a force of forty to fifty men. Their interest in the Peacock and other claims is bonded to the Boston & Seven Devils Copper Co., who work a force of forty or fifty men in developing, building and prospecting with a diamond drill.

Lewis A. Hall, president of the Export Lumber Co., of New York, is at the head of three companies which are interested in the Seven Devils—the Boston & Seven Devils Copper Co., the Pacific & Idaho Northern R. R. Co. and a reduction company that is erecting a matte smelter near Weiser. The P. & I. N. railway is operating from Weiser, Idaho, to Council, a distance of 60 miles up the river. The Weiser valley is well settled by ranchmen. The plans are to extend this road northward to the valuable timber belts of Payette lakes and the Little Salmon river. A portion of this extension will doubtless be made this year. The more important extension to be made this season, however, is the branch line from Council, up Hornet creek, via Bear, to some point on Indian creek, so as to furnish ore transportation for the mines of the copper belt.

The machinery and equipment for the smelter near Weiser have been ordered and work on the foundation is in progress. Peter H. Scott, the well-known millwright, is at Weiser to superintend the smelter construction. The plant will have a capacity of 100 tons per day, the equipment to be furnished by the Colorado Iron Works.

The Heath district, 18 miles west of Cambridge, in the river range, is characterized by a porphyritic quartz ledge, carrying copper and iron pyrites and carbonates. The ledge passes through a granite formation, with a lime capping. The Heath

Mining Co., of Philadelphia, have here a group of eight claims and a millsite. The property is being developed under the direction of E. P. Hall of Weiser, with R. S. Wolston in charge of the work.

Landore, Idaho, June 12.

WASCOTT.

Moon Lake; Thunder Mountain, Idaho.—(See Front Page).

near Camp creek, which is a small tributary of Indian creek.

There are four townsites located in the district, three on Indian creek and one near the summit at the Peacock. The first of those recently established was Cuprum, at a point on Indian creek 10 miles east of Ballard's Landing on the Snake. Five miles above Cuprum, on the same creek, is Decorah, which is about a mile from the Blue Jacket and Helena mines. A mile and a half up Indian creek from Decorah is Landore, the newest of the four and the mine headquarters of the Boston & Seven Devils Copper Co., of which W. B. Hancock is manager. Helena is 6 miles northwest from Landore, at the northern end of the ore zone, so far as explored, and is at an altitude of nearly 7000 feet. A postoffice has been established at Helena many years and it was the initial trading point of the Seven Devils. At a high point near Helena is obtained an inspiring view of Snake river canyon, the waters of the Snake appearing nearly 5000 feet below this point of view. Looking westward to the Oregon side and you get an excellent view of the snow-clad Eagle range, in the southwestern portion of which are the Cornucopia mines. The great lava plateau and the Imnaha valley of Oregon also spread out before you. There is a plentiful supply of timber in this section—along Indian creek and Bear creek it is quite heavy, consisting of yellow pine, red fir, tamarack and a great deal of white fir. Wagon roads have been built up Indian creek from Ballard's Landing to Cuprum, Decorah and Landore; also from these points via the Blue Jacket to Helena, via the Lockwood, Tousley's and the Peacock. A road or trail also runs from Helena down Deep creek to the Snake river. The points on Indian creek are reached by a stage road from Council, on the Weiser river, up Hornet creek, via Bear creek, the distance from Council to Landore or Cuprum being 40 miles. A road also extends from the Indian creek roads to Black Lake, where Ford Bros. are developing a gold property, on the east side of the Devils range, and on which they are erecting a small stamp mill. The same parties are developing a gold quartz property in Placer basin, which is about 6 miles southeast of Landore.

The River Queen is a copper mine near the Snake

Genesis of Ore Deposits.

PART I.

Written for the MINING AND SCIENTIFIC PRESS by
MAIT W. ALDERSON.

All mineral deposits were formed by streams, flowing on the surface of the earth at the time the deposits were made.

The minerals were in solution and by crystallization and precipitation formed deposits of quartz, etc., on the beds of the streams.

The size of a vein and its ore bodies is governed by the size of the stream that made the vein.

Unlike placer deposits, where the best values are on bedrock, the richest ore will be found on what was the top or hanging wall side of the stream.

The best ore will be found where the stream flowed quietly. Rich ore was not formed where the current was rapid, and, if found, will carry with it proof of its having been broken from the main body and transported to its present lodging place.

In the early history of the world the surface of the earth was not so irregular as it is to-day. Nevertheless, as the surface cooled there were flowing streams. Those streams formed deposits of gold, silver, copper, lead, etc., with their usual accompaniments. The first deposits were sulphide in character. Where these deposits were at such places in the stream bed as to be continually under water they continued to remain pyritic. Where, however, the vein matter was alternately beneath the stream and exposed to the air, the ores became oxidized.

The original surface of the earth was granite and, as a natural consequence, the first veins were formed in this rock. Vein-forming streams, having their sources in the granite ridges, can be traced to where they have, in reaching lower levels, flowed over gneiss, quartzite, slate and limestone, so the same

vein may be found in what are usually classed as different geological ages and periods.

Some veins were formed before the elevation of the present mountain ranges, and in some instances the mineral-bearing streams continued to flow after the mountains were partially elevated. In some important mineral-bearing sections, where the precious metal deposits are found in veins in the foothills, the pay shoots will be observed to take a general direction corresponding to the course of the range itself, and there will be parallel veins. The nearest range will often be perpendicular, another at an angle less steep, and oftentimes a vein—the last deposit—practically blanket in character. Following the first disturbance of the earth's surface—metamorphic or otherwise—the country between the elevations was leveled down, the lower places being filled with the detritus of places above. In time the streams formed new beds and new deposits of ore were made thereon. In some sections a number of local disturbances occurred and a number of veins are accordingly found at different angles.

In the process of cooling the exterior crust of the earth was crumpled by lateral pressure, some portions of the surface being elevated and other portions being depressed. In other instances the crust of the earth was disturbed by volcanic action. The position in which a mineral-bearing vein is found is dependent upon the manner in which a certain section of the surface has been elevated. The elevation of a given section might have been produced in such a way as to tilt the ore deposit to the side or set it on end. As a matter of fact, however, the ore deposits set on end are the exceptions; most of them will be found on their sides.

The discoveries leading to the conclusions above outlined form a theory the beauty of which lies in its practicability—its usefulness in every day work in the mines. One has a theory of vein formation on which he can depend, which fits his mine and which does not constantly require some new theory to explain slight changes in a vein or the formation in which it is found. "One truth always harmonizes with every other truth," and, unlike the theory of metasomatic action, the shearage zone theory or the fissure vein theory, this theory explains the most peculiar and complex situations. One familiar with it soon learns to depend upon it and to gain confidence in his ability to go from one shoot of pay ore in his mine to another of like character.

There is a theory to the effect that base ores are found below water level and oxidized ores above, which has been so long accepted as true that no one, apparently, thinks of questioning it. It seems almost sacrilege to break an idol which has been revered for ages, but the writer cannot recall a single mine that that theory will fit. If he calls another's attention to the fact that it does not apply to some particular mine or place, he is met with the remark, "It is the exception that proves the rule." Now, I submit that a rule that is proven by its exceptions is better honored in the breach. In such a case it would seem to be the part of wisdom to formulate a rule based on the exceptions. There is no difficulty in finding pyritic ore in Montana from the surface downwards, above water, and oxidized ore below water. In the Minah mine, at Wickes, Mont., are two shoots of ore, one of which was pyritic from the start, the other oxidized. Each has retained its character, the shoots running side by side to the lowest workings of the mine. In the Sunrise mine, Granite county, Mont., the pyritic ore occupies a higher level than the oxidized ore that has been mined. In the Bunker Hill mine, in the same county, no pyritic ore has been found in the lower levels and no oxidized ore in the higher levels. But the reverse is true, the oxidized ore being found below and the pyritic ore above; and the ore in this mine is in the exact position it was when originally deposited. In the Howard mine, Lewis and Clarke county, pyritic ore has been reached several times, but oxidized ore was invariably found again in the same shoot on sinking to lower levels. There is, practically, no oxidized ore above water level in Nova Scotia, while in Cornwall, England, vast regions of "weathered" copper ore are found "far below the level of the neighboring sea." Thus at Dolcoath "some of the earthy-brown ore was found as far down as the 197-fathom level." The fact of the matter is that there has been no change of consequence in any ore body since it was originally formed. To oxidize ore beneath the surface by the percolation of fluid carrying oxygen is an impossibility, and that is something that nature never attempts. In the first place, the ore is impermeable to the fluid, and in the second place a sufficient quantity of oxygen to bring about the reaction cannot be brought into contact with the particles which it is sought to affect. Let us take pieces of pyritic ore from mines in Nova Scotia and from some I might name in Montana, and expose them to the action of water and air. There will be very slight changes on the surfaces in the course of years. Now, let us take other pieces of the same kind of ore from the same mines and crush them and expose the crushings to the action of air and water. We need not stir them. We may leave them in a pile. In a few years they will be almost perfectly oxidized. They will form a matte of brown, oxidized ore, such as is found in the zone of oxidized ore in the mine from which the ore was taken. Let us run assays on

the freshly made concentrates and those which have been exposed to the air for a year or two. The first will require twenty grains of potassium nitrate to oxidize the sulphurets so a lead button of proper size may be obtained, and the latter five grains or less. The writer's observations have led him to the conclusion that pyritic ore is found in such portions of the bed on which they were originally deposited as were continually under water; the oxidized ore on those portions where at intervals, before the crystallized sulphurets formed into a solid mass, the surface of the ore body was exposed to the oxidizing action of the air.

It stands a man in hand to be cautious about criticizing theories that have been handed down through the centuries, but after having attempted to apply them in a practical way, only to meet with failure, what is he to do? It seems to me that the wise man will stop and investigate and see if the theory is not at fault. The writer is not alone in having abandoned the idea of veins having been formed in fissures. Our present knowledge of terrestrial physics precludes the idea that a vein could form in a fissure in the earth's surface. A crevice in the earth would have to remain open to an uncertain depth for an indefinite length of time in order that the quartz containing the precious metals might be deposited in such a crevice from solutions containing them. This could not be done for several reasons: 1. The natural contraction of the earth's surface would close the crevice. 2. If it were possible to keep the crevice open, it would be filled with debris from the surface of the earth long before it could be filled with quartz. 3. Before the water containing the quartz and gold in solution could flow upwards—as is oftentimes conceived—through the crevice, it would have to fall downwards through some corresponding crevice at a great altitude, because water will not flow uphill without being confined and forced, whether that force be hydrostatic or thermal. 4. It is not among the possibilities of nature to form a crevice in the earth with walls such as are found on the sides of so-called fissure veins. One wall will be almost invariably smooth and regular and the other irregular. Not only is it impossible to split a rock to produce such a result, but it is impossible to fracture any massive rock so the sides of the pieces will be smooth. As well might one attempt to split a candle with the expectation of the sides of the sections being as smooth as many a wall in a mine. 5. It is not possible to make the clay gouge hang to the side walls of a fissure vein while we remove the quartz. How, then, could it be made to stay there while the quartz was being formed?

Apparently unanswerable criticisms may be made against nearly all the theories thus far advanced to account for the origin of ore bodies. Kemp, in his "Ore Deposits," after considering the methods of filling of mineral veins, says—page 40: "The discussion is practically limited to lateral secretion and ascension by infiltration." The theory of "derivation of the contents of a vein from the wall rock" is utterly untenable. Take veins in gneiss, for instance. The wall rocks will be found to be practically impermeable to any solution, and, generally speaking, the ore itself cannot be successfully leached until it has been very finely crushed. Is it reasonable to suppose that waters would course through solid rock when they could find easier channels by following the stratification? Kemp, himself, says of the theory of ascension by infiltration—page 41: "This theory is of necessity largely speculative, because the materials for its verification are beyond actual investigation." Can the everyday working miner derive advantage from a theory in which the educated man who advances it is compelled to express lack of confidence?

With the knowledge that all veins were formed from substances in water flowing on the surface of the earth, or in ponds and lakes, at the time the deposits were made, and every vein carries positive proof of this, the queries naturally arise: From what source did these veins receive the minerals? How did they get into the streams and thence to the larger bodies of water? From our knowledge of the constituents of the earth, we know that vein matter is but an aggregation of what may be found in small quantities elsewhere. Thus gold, the most precious of the vein materials, is almost universally distributed, being found in infinitesimal quantities in the water of the ocean and the rocks and sands of almost every portion of the globe. It has been supposed that a part of the silica which makes up so much of the total of some veins was obtained by the solution of that substance from granite, but Le Conte tells us—"Elements of Geology," page 7: "Quartz is unchangeable and insoluble in atmospheric water." And, so far as we know, Nature has no solvent in her laboratory for gold once in the solid form. So it is impossible that the gold or quartz in quartz veins was obtained by the leaching of vast quantities of granite or other rock containing large quantities of silica and very small amounts of gold. We must look elsewhere for the source of supply.

Various attempts have been made to prove that the contents of veins came from the bowels of the earth. Many authorities consider that in some way or other volcanic action has had much to do with the formation of veins, even in the face of the fact that the different kinds of lava are the most barren of the

precious metals of any of the rocks. In reality, there is no reason to expect values in any molten rock, for what is such rock but the slag of Nature's operations in melting? Any of the precious metals, if present before the melting, would either be sublimated or left in the bottom of the furnace. Our knowledge of metallurgy tells us that the heat generated in volcanoes would volatilize most metals. Possibly there would not be sufficient heat to volatilize iron, and we find, accordingly, that that is the one metal found in any quantity in lava. But sulphur and galena would volatilize quickly, and it so happens that these are most abundant in the veins known to be of earliest origin. Then, it is not hard to find beds of what seem to have been volcanic ashes in what was the bottom of the stream on which quartz was deposited, as is the case in several mines in Lewis and Clarke county and Jefferson county, Mont. If, near a smelter where sulphide ores are being treated, we place a sheet on the ground, on the side of the smelter to which the smoke curls, we will soon find it covered with little black specks, showing the burn of sulphuric acid. This is a practical demonstration of what Nature might carry out on a larger scale. We have good reason, therefore, to assume that the precious metals, the sulphur and the silicon entered the air as gases from the throats of volcanoes, where they would be changed to a fluid state, and in this condition reach the surface of the earth and the flowing streams.

Whether on further investigation this view of how the precious metals came into the solutions from which they were crystallized and precipitated to form veins of quartz be demonstrated as correct or not, there can be no question but that the veins themselves were made by flowing streams, and the practical mining man is more interested in how to read his vein and in keeping in pay ore than in any theory as to where the metals may have come from. In a future article, therefore, I shall give directions whereby one may follow his ore with certainty by following the original course of the ore-bearing solutions, pointing out, also, how one may know when he has reached the probable limit of pay ground in his mine in any given direction.

(TO BE CONTINUED.)

Smelting of Siliceous Lead-Copper Ores (Carbonates) at Llano, Sonora, Mexico.

Written for the MINING AND SCIENTIFIC PRESS by ARTHUR HAUMAN.

I.—Composition of ores and fluxes:

	Lead-Copper Ores.	Iron Ores.	Dolomite.	Coke (Alabama).
SiO ₂	48.0%	21.0%	6.0%	10%
FeO.....	8.8%	36.4%	3.0%	8%
				(Al ₂ O ₃ +F ₂ O ₃)
CaO.....	2.0%	12.0%	26.0%
MgO.....	1.5%	19.5%
Cu.....	10.0%
Pb.....	13.5%	5.0%
Sb.....	2.0%
	O,CO ₂ ,AgAu	O,CO ₂ ,AgAu	CO ₂

II.—Plant: Round (36" di.) water-jacket blast furnace. No. 4 Root blower.

III.—Capacity: 40 tons in 24 hours.

IV.—Bullion analysis: Cu, 55.5%; Pb, 40%; Sb, 1.8%; Au, 5.5 oz.; Ag, 78 oz.; S and Fe, traces.

V.—Slag analysis: SiO₂, 41%; FeO, 21%; CaO, 20%; MgO, 8.6%; Al₂O₃, 0.7%; PbO, 1.3%; CuO, 0.7%; total, 93.3%, being a sesquioxide of the formula, (2CaO, FeO, MgO) 3 (SiO₂), or 4RO+3SiO₂, O in bases 4; O in acid 6=1:1½.

VI.—Cost of smelting:

(a) Labor—	
3 Feeders, Mexican, 8 hrs., \$1.....	\$ 3 00
3 Asst. feeders " 8 hrs., 75c.....	2 25
3 Tappers " 8 hrs., \$1.....	3 00
6 Pot wheelers " 8 hrs., 75c.....	4 50
2 Firemen " 12 hrs., \$1.....	2 00
4 Carmen " 10 hrs., 75c.....	3 00
1 Blacksmith " 10 hrs.....	2 00
1 Night foreman " 12 hrs.....	2 50
1 Day " white 12 hrs.....	5 00
1 Assayer ".....	2 50
1 Superintendent ".....	12 00

Cost of labor 24 hrs.....\$ 41 75

(b) Coke 17% of 40 tons at \$17 per ton.... 115 60

(c) Water (hauling)..... 25 00

(d) Ore and flux to mine, break and haul at \$2..... 80 00

(e) Wood (for power)..... 3 50

Total.....\$265 85

Add 10% for unforeseen delays, etc..... 26 60

Net total.....\$292 50

Net cost to mine and smelt a ton... 7 31

Net cost to smelt a ton..... 5 31

[The U. S. money equivalent of these figures is approximately \$3.65 and \$2.65 a ton.—ED.]

As shown by analyses, the ores are oxidized, carbonates, very siliceous. The iron flux was very poor, comparatively high in SiO₂ and low in Fe. However, this being the only material on hand at the time, and as it carried enough Ag and Au to warrant its use, the best advantage had to be taken.

The dolomite on hand brought, as the slag analysis

reveals, the MgO up to 8.6%. Authorities on lead smelting decry the use of dolomite as flux, the MgO being an undesirable constituent of the slag mixture; nor do they advocate a high siliceous slag or one low in iron.

Studying the situation, and hunting in vain through "Peters" and "Hofman" to find some one in a similar "fix," it was concluded to start with a fairly basic slag and run it up to the maximum of SiO₂.

Some experiments with crucible charges were tried, although they could not duplicate the conditions in the blast furnace. After heating to a bright yellow, the crucible charges were finally poured and the slag analyzed: SiO₂, 40%; CaO, 24%; FeO, 8%; MgO, 9%. The deficiency in iron was caused by reduced iron, found at the bottom of the crucible. No concern about this latter phenomenon was felt, however, as the contents of the furnace would be frequently (every ten minutes) removed, giving very little chance to form "sows," especially with a high siliceous charge.

In comparing the crucible trials with the final slag made at the smelter, the results came as close as could be desired, except the percentage of FeO, the deficiency having been explained. The slag settled on, ran magnificently, very liquid, and was remarkably free from prills of metal, the Cu and Pb contents as low as could be expected, without use of a forehearth. The use of the latter would be out of question for a furnace below eighty tons capacity. It was found advisable to run on an 18% fuel charge, although the furnace would run on 16½% coke.

The average analysis of slag showed 41% SiO₂; there were periods when it would run up as high as 45% SiO₂. In order to tide over these danger points, the furnaces had to be kept very hot, using somewhat more fuel; a sharp lookout was kept for overfire, which would cause a chill in short order near the melting zone. No such chances can be taken with a small forty-ton furnace as with a larger one, which can be "brought around," chills in an astonishingly short time, especially if the blast is not cut down immediately and the top fire smoldered.

The bullion had a specific gravity of 6, the slag 3.2 to 3.6, insuring a good separation. According to the deduced formula, the slag contained one-fourth of the base magnesia. Although the latter is credited with forming a sticky, pasty slag, no trouble was experienced in this case. "Balling" informs us that any mixture of two or more silicates has a lower formation point than each individual single silicate; and in the case of the earths, that their bisilicates (and a mixture of two or more) are more liquid than their respective single and sesquisilicates.

Although in this case the slag was calculated for a sesquisilicate, at times there must have been a large excess of SiO₂, which was taken care of without the serious consequences of a "freeze up" by MgO and CaO to form their bisilicates.

As emphasized before, MgO amounted to one-fourth of the bases. Prof. Hofman, in a late paper, gives the benefit of his experiments with silicates. He found that if magnesia replaces one-eighth of the lime the formation temperature rises, then it falls until one-fourth has been replaced, then it rises until one-half has been replaced, etc. The behavior of the slag would bear out this statement. The writer was aware that successful slags had been made running as high as 55% in silica and low in iron. The proverbial Mansfield slags, which, like the unfortunate Table mountains of California are mentioned in every text-book, and the Deadwood slags are examples; but in either case hot blast was used or sulphide ores were treated.

In this case a highly siliceous oxidized lead-copper ore free from sulphur had to be smelted. Previous attempts to smelt it in reverberatory furnaces ended in a total failure; concentration dry or wet was out of the question.

No sulphide ores being in the neighborhood, no matte was formed and all the values Au, Ag, Cu and Pb were found in the bullion. Although running up between \$300 and \$400 a ton, the bullion is not a very desirable one, because:

1. Being high in copper (55%), it can not be refined with the customary lead bullion; the refining work has either to make an extra run or mix it with other lower grade bullion, or it has to be refined at the spot, which would not pay for lots below 100 tons.
2. It is difficult to sample; sometimes a copper dross or lead layer forms on the surface of the pigs. Bottom and top must be drilled—a painfully slow job with a hand ratchet drill. There are hardly two pigs which assay alike.
3. No siphon tap or lead well can be used; the alloy would chill the discharge pipe.
4. Great care has to be taken to tap all the metal out of the crucible and rinse the orifice with hot slag, driving home a steel bar immediately; no bar will penetrate the tough metal once chilled in the spout. The "cheap" Mexican labor could advantageously be replaced partly by skilled white labor. "Peppi" would never hurry to "tap" even if the slag threatened to depart "via tuyeres." At the feed floor, if not watched, he would ignore the scales entirely, dumping in the furnace whatever was nearest. One "experto" would load his shovel by picking up with one hand carefully one-half dozen lumps of ore; or another, never having seen a rake, would use it as a pick. The many days of the saints are scrupulously

observed with drinking, singing and dancing; and if the peddler selling the mescal (a vile brandy made of cactus) on the sly is not caught in the nick of time, the whole crew will drink and fraternize till the last "centavos" is spent, then "Peppi" will be a "bueno muchacho," till the next peddler causes another shutdown. "Manana" (to-morrow) is as often heard as the word "money" in the United States. Still the people live and are happy—true philosophers—never worrying for manana, which is not always true of the man in charge of a plant, who has to play at times tapper, feeder or foreman till "Peppi sables." He will, perhaps, manana!

The Formation of Bonanzas in the Upper Portions of Gold Veins.*

BY T. A. RICKARD, DENVER, COLO.

INTRODUCTORY.—The presentation to the Institute eight years ago of the paper of Posepny on "The Genesis of Ore Deposits," has borne fruit in much fresh investigation, as is evidenced, for example, by the group of very valuable papers, by distinguished members of the United States Geological Survey, read at the Washinton meeting—discussions of general principles particularly suggestive to those who are engaged in mining.

Posepny, in the discussion of his famous treatise, said that the present writer seemed to look at every new conception in the ore deposition "from the sole standpoint of its immediate usefulness in mining." Protesting mildly against "sole" and "immediate," I accept the impeachment. It calls for no defense.

THE DEVELOPMENT OF RECENT THEORIES.—Given the idea of an underground water circulation as the chief factor in the deposition of ore, the next step in the inquiry as to the genesis of such deposits is the endeavor to determine which particular part of the general water circulation is responsible for the results. Around this question have centered the controversies of a generation, and to these controversies we owe the gradual clarification of our ideas upon the process of ore formation. It is unnecessary to sketch here their progress from Werner to Le Conte, who combatted in 1883 the extreme views of the lateral secretionists, and in 1893 opposed the narrow interpretation of the ascensionist theory. The generally accepted opinions of to-day are a well deserved tribute to his philosophic discrimination.

Thanks to Prof. Van Hise and Mr. Slichter, whose work he utilizes, we have now arrived at a comprehensive conception of the underground circulation, which emphasizes the conclusion that sulphide ores are generally deposited by ascending waters. In estimating the importance of this conclusion, it is to be remembered that, apart from placers and iron mines, the largest portion, by far, of the ores exploited by the miner are sulphides. Moreover, it has been shown that the other, equally essential, parts of the circulation, namely, its lateral and descending portions, particularly the latter, also play their part, to which many "secondary enrichments" are due.

This approach toward an understanding of the processes of secondary enrichment in ore deposits is an extremely important advance in the application of geology to the exploitation of mines. For such enrichments pre-eminently constitute the ore masses valuable to man. Chemistry and physics may unite in determining the conditions favorable to the precipitation of gold; geology may unravel the intricacies of rock structure, but it does not come within the province of these sciences to decide whether a gold vein will prove rich enough for profitable mining. Nature knows no ratio of sixteen to one, or any other standard of monetary value. Therefore, the determination of the particular conditions favorable to the mere occurrence of gold ores remains but a barren discovery until it includes some suggestion as to the search for the richest portions. To the geologist, material carrying 2 dwts. of gold per ton is as truly an auriferous deposit as if it contained 12 dwts. per ton; but, under existing economic conditions, the miner may regard the former as only fit for macadam, and the latter as potential of fortune.

When the science of ore deposits, therefore, has predicted with certainty the places where gold can be found, it has fulfilled a conclusive test of a true theory. But this means to the miner no more than the restriction of his search for profitable gold deposits to those places where there is any gold at all—a restriction which, after all, amounts to little, for the progress of scientific inquiry and practical exploration has rather enlarged than diminished the field of the distribution of this metal. A greater service will be the determination of the conditions which control the formation and distribution of those particular portions of the multitudinous deposits of gold which constitute the secondary enrichments of the geologist and the bonanzas of the miner.

Such a desired consummation seems now to be nearer of attainment. The practical result of the papers of Van Hise, Emmons and Weed will be to direct attention to the one line of inquiry most useful to the miner. Unquestionably the theories of secondary enrichment have been largely suggested by the experience of the men whom the geologists have

met at the mines; and the invaluable assistance thus given to mining engineers is a pleasant outcome of such an exchange of views.

THE ENRICHMENT OF GOLD VEINS NEAR THE SURFACE.—A quartz lode carrying gold in association with pyrite is here taken as the type of deposit under discussion. In lodes of this kind it is a common experience to find bodies of rich oxidized ores extending to a variable depth from the surface. In this general phenomenon of enrichment two processes must be separately recognized, namely, relative enrichment by the deposition of additional gold through secondary reactions.

ENRICHMENT BY CONCENTRATION.—The iron sulphide accompanying the gold is removed by weathering. Weathering is a process of chemical decomposition and mechanical disintegration in which oxidation is aided by the shattering of the rock due to the alternate expansion and contraction of the water present in its pores, seams and cavities. The depth to which these effects extend will depend upon the facilities afforded for the penetration of surface waters carrying free oxygen; and it will be regulated by the local groundwater level. The results observed usually cease at the groundwater level, because at that horizon the descending surface waters become mingled with the larger body of neutralized water, and so lose their free oxygen. When, however, they can find channels permitting a relatively rapid passage, they may not become at once diffused, and may thus continue their oxidizing action even below that level. But the actual lowering of the groundwater level, by a change of surface altitude or hydrostatic conditions, affords the chief factor in enlarging the scope of such oxidizing action on the part of the surface waters. The chemistry of the process is pretty well understood, and need not be discussed here.

In the case of enrichment by concentration the evidence indicates that the leaching and removal of the pyrite has been affected without shifting the gold, which remains behind in its native state. I have specimens from Idaho and West Australia exhibiting crumbly native sulphur, within the cubic cavities vacated by the pyrite, and in those from West Australia there is also gold in fine crystals which are readily shaken loose. The removal of pyrite; the occurrence of fine particles of gold in the vacant casts produced by this removal, and the formation of a sinter honeycombed mass of iron-stained quartz are familiar aspects of the process of natural concentration.

Weathering, then, by removing the baser and more soluble constituents of the vein, decreases the weight without diminishing the volume of the ore, which thus becomes so much the richer per ton. Iron-stained gossan, rich in gold, is a familiar occurrence in mining, and the frequent development of such material has had a far reaching effect in determining the character of the industry. Apart from the richness of such oxidized ore, its metallurgical docility greatly enhances its value. In comparison with the unaltered and relatively refractory pyritic ores, the oxidized material is not only easier to crush, but also easier to treat by amalgamation, chlorination, etc. Hence the contrast which is occasionally offered between the early successes of the discoverers of a gold vein and the subsequent troubles of the mining company which buys their property. The gossan of the gold vein has been the source of a large part of the world's store of the precious metal; and to it we owe the successful beginnings of many districts, which, if they had been compelled to commence operations upon refractory pyritic ore, would have waited long for their active development.

SECONDARY ENRICHMENTS DUE TO DESCENDING SURFACE WATERS.—The diagnosis of the general process by which these are formed by descending waters has been stated in clear terms in the contributions of Van Hise, Emmons and Weed.

The occurrence of restricted bodies of extraordinarily rich gold-bearing quartz has been a startling feature of gold mining in all countries. From them fortunes have been made with picturesque suddenness; and by means of them the inexperienced have been led into sanguine expectations, the failure of which has brought disasters not less romantic, though much less welcome to their victims. Such instances have furnished matter for proverbs concerning the uncertainty of mining; but they are soon forgotten. Nevertheless, the uncertain occurrences of rich ore on which they are based present an important feature of the ore deposits in all gold mining districts, though they are more particularly characteristic of desert regions, such as the area of the Great Basin, stretching between the Rocky mountains and the Sierra Nevada, and also those arid parts of Australia and West Australia which have yielded so much of the wealth of the colonies.

The outcrop of a gold vein is not always the richest portion. The sinter gossan formed at the immediate surface may be poor in gold, and yet may be succeeded near, or even below, the water level, by extremely rich masses of half-decomposed pyritic ore. In such cases it would appear that the gold had been leached out of the oxidized portion of the lode, and had migrated in the wake of the iron until precipitated, so as to form the secondary enrichment now under discussion.

In considering the formation of these bonanzas, one

* Trans. Am. Inst. M. E., Richmond meeting, February, 1901.

of the first problems presented is the question of the mode of occurrence of the gold in the pyritic quartz of the lode. The evidence as yet available indicates that the gold does not exist in chemical combination with the iron sulphide of the pyrite, but usually occurs in minute filaments or crystal aggregates distributed through the substance, and especially along the structural planes of the pyrite. In my collection I have a handful of fragments of pyrite obtained from the Orphan Boy mine in Boulder county, Colo. This mine was the beginning and end of a mining excitement which happened in the spring of 1892, in connection with a locality named Copper Rock. Under a magnifying glass the specimens exhibit little crystals of gold, which, by the rounding of their edges, appear in places as globules distributed over the facets and in the crevices of the pyrite.

Mining and Metallurgical Patents.

Patents Issued June 25, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS

ORE WASHING MACHINE.—No. 676,905; W. O. Miller, Galena, Kans.

The combination of a separating surface, a rotating distributing cone above surface, provided at apex with a cup which generally lies below surface of cone, and is provided with flanges overhanging cone, and delivery device comprising a closed hollow ring, and spray tubes depending from ring nearly to bottom of cup.

ORE CONCENTRATOR.—No. 676,969; A. H. Stebbins, Little Rock, Ark.

An undulating casing provided with an inlet and an outlet and having a gradually increasing cross sectional area from inlet to outlet, upper and lower walls of undulating casing being correspondingly curved to form oppositely curved elevations and depressions, in latter of which, formed in lower wall, concentrates may settle, so that a blast of air striking down bend or curve in upper wall of casing blast will be deflected to strike concentrates in lower part of curve in lower wall of casing to effectually clean concentrates collected and to separate lighter from heavier concentrates.

RECORDING DEVICE FOR HOISTS.—No. 677,286; F. M. Stanton, Houghton, Mich.

A recording web, means for moving same at a predetermined speed, a stylus, means for moving it across web at a speed proportioned to that of moving element to be timed, means for causing stylus to be brought into contact with web, and means for periodically deflecting stylus from normal or main path of movement.

PROCESS OF ROASTING MIXED SULPHIDE ORES.—No. 677,263; E. C. H. Pape and C. A. L. W. Witter, Hamburg, Germany.

Process of treating sulphide ores containing metals which are volatile at a temperature at which they cannot combine with oxygen, which consists in heating a combustion chamber to temperature necessary to ignite sulphides in ore, introducing a heated current of air in chamber, then feeding finely divided ore into chamber so that it passes through current of heated air, maintaining temperature above that at which a part of metals can combine with oxygen, allowing metallic vapors carried forward to combine with oxygen, and then collecting the matters so carried forward.

ELECTRIC SMELTING FURNACE.—No. 676,985; H. Koller, Nuremberg, Germany.

The combination of two end electrodes, and means for supporting them above bottom of furnace, and a disconnected intermediate electrode, having means for supporting same intermediate of and approximately in same level as end electrodes, and a series of disconnected electrodes on bottom of furnace intermediate of ends of raised electrodes.

PROCESS OF EXTRACTING METALLIC OR NATIVE COPPER FROM ORES OR TAILINGS.—No. 677,089; J. C. Kessler, Milwaukee, Wis.

The process for extracting metallic or native copper from ores or tailings, consisting—first, placing such ores or tailings in an uncovered water-tight receptacle; second, in application thereto, for a suitable period of time, of a solution of any cupric compound in ammonia; third, in forming a liquid seal upon surface of solution; fourth, in drawing off and separating concentrated copper solution from remaining tailings; fifth, in precipitating, by electrolysis, about one-half of copper contained in concentrated copper solution; sixth, in returning solution back to tank for repeated use upon other untreated ores or tailings; seventh, in precipitating by electrolysis all copper contained in so-called weak solution; and eighth, in the application of weak ammonia solution remaining, after the copper has been thus precipitated (instead of fresh water as in the first instance), to tailings or ores subsequently treated in leaching tank.

PUMP BATTERY SYSTEM.—No. 677,217; E. M. Ivens, New Orleans, La.

The combination with channel bars 1 1' and transverse bars 3; of cast pit 2, having closed sides, bottoms and ends, and lateral seat flanges 2', at a point below its upper edge, whereby the upper ends of sides thereof form abutting portions for adjacent ends of bars 1 1', and flanges form connecting supports for channel-bar ends.

Portable Belt Conveyors.

The Robins Conveying Belt Co., of 15-21 Park Row, New York, has recently perfected and patented some new forms of portable or movable conveyors for various services, two of which are here illustrated. Fig. 1 shows a conveyor which was built for filling

FIG. 1.

FIG. 2.

stopes with rock at the mines of the Moctezuma Copper Co., Nacosari, Mexico. Fig. 2 shows a conveyor which was shipped to a foreign port for loading coal into vessels.

Portable conveyors are of especial value to contractors and miners, being useful for loading and unloading vessels and cars, for stacking coke, carrying material from excavations and for other similar purposes.

The Robins portable conveyor is claimed by its manufacturers to be in all its forms entirely self-contained. It consists of a belt conveyor mounted on a light steel frame and driven by a direct-gear engine or motor as may be desired. The truss or frame is of light but rigid construction and is built in short, separate sections which are bolted together. By leaving out or putting in one of these sections, the length of the conveyor may be varied up to 50 feet to suit the requirements. The frame is designed to protect the running parts of the conveyor against the blows and rough usage which this kind of machinery always receives, and the engine or motor is enclosed and protected from dust, as are also all the bearings in the machine.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

KETCHIKAN.

S. I. Silverman of Spokane, Wash., says of Prince of Wales island that he has bonds on forty claims on Copper mountain, on Copper harbor, on the west coast of the island. On the eighteen claims bonded from the Alaska Copper Co. of Juneau there has been considerable work done and on one of the ledges an ore shoot 400 feet long and 20 feet wide developed that gives very high copper values. A tramway a mile long has been built to a wharf at the harbor and a sawmill and buildings constructed. The ore is malachite and chrysocolla in a quartz gangue and will go 30% in copper, besides carrying good values in gold and silver. It can be smelted at the mine to an 85% matte at a cost of not more than \$3 a ton. The general appearance of the country is like Rossland, B. C., in 1894. There is a difference in the respective ore zones though. In Rossland the ore zone was 3 miles long and 1 mile wide. Prince of Wales island is 140 miles long and 40 miles wide and it looks as if mines would be found all over it. It looks as though the rush to the island had already commenced. There are nearly 500 miners at work now. P. Clark of Spokane, Wash., is working a gold property on Twelve-Mile Arm. J. Freeburn, formerly with the War Eagle and Le Roi, at Rossland, B. C., has been examining mines on the island for the last year. S. Lichtenstadter of Salt Lake City, Utah, is working the Mount Andrew group of copper claims—a mountain of ore. H. Bratnober of the London Exploration Co. is with him.

ARIZONA.

COCHISE COUNTY.

The Lowell & Arizona C. M. & S. Co. have sold all their mines and plant at Bisbee to the Copper Queen Con. M. Co. for \$500,000 cash and the property is now operated by the buyers. The stock in the first named company is being retired and it will go out of business. Bisbee, Ariz., June 27.

CALIFORNIA.

The total yield and value of mineral substances of California, for the year 1900, are reported in the appended table by State Mineralogist Lewis E. Aubury. The figures were obtained in response to inquiries made of producers:

Antimony, 70 tons.....	\$5,700
Asbestos, 50 tons.....	1,250
Asphalt, 12,575 tons.....	253,950
Bituminous rock, 25,306 tons...	71,495
Borax—	
Refined, 1602 tons.....	165,036
Crude, 24,235 tons.....	848,215
Cement, 62,000 barrels.....	121,000
Chrome, 140 tons.....	1,400
Clay—	
Brick, 137,191 M.....	905,210
Pottery, 59,636 tons.....	60,956
Coal, 176,956 tons.....	535,531
Copper, 29,515,512 pounds.....	4,748,242
Fuller's earth, 500 tons.....	3,750
Gold.....	15,863,355
Granite, 311,803 cubic feet.....	295,772
Gypsum, 2522 tons.....	10,088
Lead, 1,040,000 pounds.....	41,600
Lime, 312,517 barrels.....	283,699
Limestone, 32,791 tons.....	31,532
Lithia mica, 440 tons.....	11,000
Macadam, 360,597 tons.....	262,570
Magnetite, 2252 tons.....	19,333
Manganese, 131 tons.....	1,310
Marble, 4103 tons.....	5,891
Mineral paint, 529 tons.....	3,993
Mineral waters, 2,456,115 gallons	268,607
Natural gas, 40,565,500 cubic feet	34,578
Paving blocks, 1192 M.....	23,775
Petroleum, 4,329,950 barrels.....	4,152,928
Pyrites, 3642 tons.....	21,133
Quartz crystals.....	18,000
Quicksilver, 26,317 flasks.....	1,182,786
Rubblie, 428,690 tons.....	299,072
Salt, 89,338 tons.....	204,754
Sand—	
Glass, 2000 tons.....	2,000
Quartz, 200 tons.....	200
Sandstone, 378,468 cubic feet...	254,140
Serpentine, 350 cubic feet.....	2,000
Silver.....	1,510,344
Soda, 1000 tons.....	50,000
Slate, 3500 squares.....	26,250
Tourmaline.....	500
Turquoise, 500 pounds.....	20,000
Total.....	\$32,622,945

In the previous year the total product was valued at \$29,313,460, so that the increase for the year is \$3,309,485. The total product of metallic substances for the year 1900 was \$23,358,730, an increase of \$2,053,707. This includes gold, silver, mineral paint, quick-

silver, antimony, copper, lead, manganese and chrome (silver is given in coining value).

The total value of non-metallic substances was \$2,177,197, a decrease of \$268,873. This includes borax, coal, mineral waters, salt, asbestos, gypsum, magnesite, pyrites, lithia mica, fuller's earth, quartz crystals, soda, tourmaline and turquoise.

The total value of hydrocarbons and gases was \$4,512,951, an increase of \$1,332,931, including asphaltum, bituminous rock, natural gas and petroleum. The total value of structural material was \$2,574,067, an increase of \$191,720. This includes brick and pottery clays, hydraulic cement, lime and limestone, macadam, rubble and concrete rock, paving blocks, marble, granite, sandstone, serpentine, slate, quartz sand and glass sand.

The relative value of the principal mineral products of the State is as follows: First, gold; second, copper; third, petroleum; fourth silver; fifth, quicksilver; sixth, borax.

There are 28,672 men employed in the industries represented in the above table.

RELATIVE RANK OF COUNTIES.

1.—Shasta.....	\$5,574,026
2.—Los Angeles.....	2,155,198

Total.....	\$32,622,945

CALAVERAS COUNTY.

A syndicate of Pittsburg, Pa., people has bought the Calaveras G. M. Co.'s mine and mill for, it is reported, \$40,000. Of this \$10,000 has been paid and the balance is due in twelve months.

The Melones G. M. Co., at Robinson's Ferry, has discontinued work underground pending the completion of the mill. The concrete foundation started several months ago is being completed.

A strike has been made in the Alpine mine, H. C. Swank owner, near Washington Ranch; 20 feet down ribbon rock was struck that is expected to mill \$125 a ton. The ledge is 4½ feet wide—22 inches of it very rich.

The Lockwood mill, at West Point, is running on good ore.

A. Brown, manager of the Lost Log mine, at Jenny Lind, has Supt. Phelps at work taking out the water. As soon as the shaft is free, a thorough investigation of the mine will be made.

EL DORADO COUNTY.

In the St. Clair mine, at Kelsey, drifting on the ledge at 100 feet depth is being done. The last clean-up paid well, so it is said.

At the Eureka slate quarry about fifty men are employed, and as soon as the two new hoists are installed about fifty more men will be added to the force. A large boarding and bunk house and several other buildings are being constructed and covered with slate.

The Zantgraft mine at Rattlesnake Bar has been closed down temporarily.

MONO COUNTY.

Work on the Castle Peak mine, near Bridgeport, is suspended temporarily during the absence of A. D. Cullom in London, to which place he has gone to put the mine into a stock company. The manager, J. J. Kermeen, is at the mines, and J. S. Cain of Bodie is owner's agent during his absence.

PLACER COUNTY.

Supt. Rodger has gone to Shady Run to commence operations at the Cedar Creek gravel mine. The main tunnel, now in 1200 feet, will be extended 400 feet.

A new bedrock tunnel has been started to tap the blue gravel channel in the Bob Lewis No. 2 at Damascus. It is expected that the channel will be reached in 1200 feet. Power to run machine drills is conveyed from the Red Point compressor plant. H. M. Jarvis is Supt.

SHASTA COUNTY.

The increasing number of copper matte smelting plants in Shasta county is making quartz mining there more profitable. The copper ores do not carry enough silica to make the proper slag mixture for the smelting. The gold-bearing quartz ores of the district of Shasta county closest the copper works are low grade and either unworkable by amalgamation or practically so. The Keswick smelter has been buying these ores, probably, of course, with reference to their gold and silver content, but the increasing smelting capacity and demand is making it necessary for the smelting companies to own the mines in order to insure the delivery of a sufficient quantity of the quartz. The amount of ores rich enough to tempt exploitation for direct profit is relatively too small to supply the smelter demand, so lower grade mines of large quantity are under consideration for purchase as a protection against the probable necessity of paying a bonus for silica when new smelters now under construction begin requiring more than the normally mined gold quartz ore. Among the mines under consideration for purchase by the Mountain Mines Co. at Keswick are the Texas mine in Old Diggings district, owned by the Bank of Tehama County, bonded by the Texas M. Co., which has been examined with a view to purchasing it at \$120,000; also the Reid mines, in the same district, owned by Reid, Clendenin & Salvane of Redding, Cal., bonded by D. McCarthy of Keswick.

The wire tramway from the Central mine to the Central mine spur, on the main line of the railway, is carrying ore from the Central, Evening Star, Mammoth and Reid mines. All of it goes to the Keswick smelter.

The South Fork D. Co. of Lowell, Mass., is driving on a 2900-foot long tunnel. The company has bonded and bought the J. P. Wright, J. K. P. Lewis and the Chicago group, on Chicago ridge. When this tunnel is completed it will tap the ore bodies of the Chicago after passing through the Wright and Lewis groups. The company is operating a double air compressor drill in driving the tunnel.

A. J. Bogard and E. J. Blossom of Red Bluff, Tehama county, have an eight months' bond from J. and O. Ames and F. Green on their mine near Harrison Gulch. They will construct a tunnel about 150 feet long to cut the ledge about 100 feet below the surface.

SIERRA COUNTY.

The Gibraltar gravel property, above Poker Flat, is soon to be reopened by the company owning it.

The new strike on the Amethyst location at the Black Bear quartz mine promises to be one of the biggest paying ledges in the section. It is a 23-foot ledge which carries gold all through it. It is south-west of the old Yellow Jacket works and a tunnel was run through it at one time. The mill, tracks and tramways are being repaired.

The Clinton & Clark ledge, on the North Fork of Salmon, above Sawyer's Bar, is reported to be from 40 to 50 feet in width, and gold can be seen with the naked eye in many places on the vein.

The Ruby drift mine at Forest has been bought by W. Wolf, who is building a stamp mill to crush both the cemented gold-bearing gravel and quartz from the ledge developed from its discovery in drifting in the bedrock gravel.

SISKIYOU COUNTY.

The Salmon River H. M. Co., operating the Meyers claim at Sawyer's Bar, is getting a good season's run. C. S. Fitch is manager. The company will have about two more seasons' run on this claim.

TUOLUMNE COUNTY.

V. Gianelli is in San Francisco to buy machinery for the Cable and Monitor mines, near Carters. A shaft is being sunk on the former and \$30 ore is being taken out. On the latter a tunnel that will cut the vein 40 feet down is being run. J. Heinberg is Supt.

YUBA COUNTY.

The debris impounding works at Degurre Point on the Yuba river will consist of several structures. The upper barrier will extend 40 feet above the present bed and entirely across it, a distance of 1000 feet. It will consist of gravel, cobbles, brush, rock paving and some masonry on its lower slope, a masonry crest and a double row of sheet piling in its toe. It will be built up gradually as the debris accumulates behind it, and is expected to hold coarse material. Barrier No. 2 of similar construction will be a half mile further down stream. It will have a 600-foot wide bypass and will not be as high as the other. The storage capacity of coarse material is estimated at 36,000,000 cubic yards. Two more barriers, and a settling basin for fine sediments are planned, the latter to hold 14,000,000 cubic yards. The total cost of the works, it is estimated, will be \$729,656.

COLORADO.

The United States Reduction & Refining Co. has been incorporated in Denver with capital \$10,000,000, of which \$4,000,000 is preferred stock and the remainder common. C. L. Tutt of Colorado Springs is president. The new company will amalgamate the Standard and the Colorado-Philadelphia smelters at Colorado City, and the Metallic, the Union and the National cyanide mills at Florence. The officers of both the United States Red. & R. Co. and the American S. & R. Co. deny that it is the intention of the two corporations to combine.

CHAFFEE COUNTY.

Pennsylvania people have incorporated the Huron Peak M. Co., capital \$125,000, to operate a mine of the same name on Huron peak. The officers are: J. F. Stine president, A. E. Stabler secretary, and W. Wallace manager. The company's property shows ore in four places, giving \$4 in gold and sixty ounces in silver. A tunnel of 135 feet has been driven on the ore. The company expects to be shipping ore soon.

GUNNISON COUNTY.

The Forest Hill Co., operating in Taylor park, has recently opened another body of ore, and L. Cavnah, president and general manager, is making arrangements to commence shipments. The new strike carries considerable zinc, but is rich enough to pay the penalty and leave a handsome margin of profit. The company is making an effort to secure the building of a road which will give it an outlet to the railroad.

HINSDALE COUNTY.

The Ohio group at Lake City has been sold to the Hotchkiss Mountain Co. for \$500.

LAKE COUNTY.

Henderson & Munro of Winfield have arranged with San Francisco parties to develop a group of fifteen claims by running a 3000-foot tunnel, cutting Mineral hill. A company has been incorporated by L. M. Turner of San Francisco, J. B. Henderson and H. Munro of Winfield. L. M. Turner is president. The company will also put in a 2000-foot tramway to the mill and build the latter.

SAN JUAN COUNTY.

It is said that the option held by the Boston syndicate of stockholders of Calumet and Hecla, Mich., on the North Star, on King Solomon mountain, will be taken up. The price is about \$200,000.

SAN MIGUEL COUNTY.

The Butterfly-Terrible statement of May operations gives the gross output at \$13,000; operating expenses, \$6500; net profit, \$6500.

SUMMIT COUNTY.

The Mecca G. P. M. Co. is hoisting rich bedrock gravel, two tests made on the richest streaks giving returns of \$130 to \$140 per cubic yard. The management is contemplating the installation of a hydraulic elevator plant this season.

TELLER COUNTY.

The production for June has been the lightest known for several months past and the grade of ore shipped, especially the smelting grade, has been extremely light. Even with the light ore production of the month the decrease in values amounted to only about \$300,000. The figures given out by the various reduction works and smelting companies are as follows:

Union.....	6,500	\$25.00	\$152,500
Economic.....	3,700	30.00	111,000
Dorcas.....	1,600	21.50	34,400
Colo.-Phila.....	18,000	40.00	560,000
Smelters.....	18,000	40.00	720,000

Total.....45,800 tons.....\$1,577,900

The Isabella Co. at Cripple Creek is reported to have leased two of its dumps, the old Smuggler dump to the Babbitt Bros., and Colonel Murray is to work the old Buena Vista dump. On the subject of dump leases there is quite an activity at

Cripple Creek. On Bull hill, between Independence and Altman, a number of operators are employed. Some have the cylinder washers, while others use the more primitive method of shoveling the waste rock into a small trough.

IDAHO.

BLAINE COUNTY.

Col. N. J. Sharp of Halley reports that he recently bonded the Copper Basin group of seventeen claims to J. W. Mackay of New York at \$155,000, and that the work of developing the property will begin at once.

IDAHO COUNTY.

G. Runkle, Supt. of the Lolo Pioneer G. M. Co.'s mines near Pierce City, reports that the company is preparing for the construction of a mill this summer. The Bitter Root claim has been developed 100 feet deep in crosscuts, showing the ore body 62 feet in width. The ore is entirely free-milling.

The Iron group of mines, on Newsome creek, has been bonded by G. S. Bailey and J. Justice of Clarkston for \$30,000. Bailey & Justice will begin development at once.

KOOTENAI COUNTY.

A rich ledge of free milling gold ore has been discovered at Tyson by J. Tyson, F. P. Mathews and A. C. Schroder. The new ledge is about 9 inches wide. As a result, general activity in quartz prospecting prevails and reports of lucky finds are plentiful, and beautiful specimens are being brought in. At the miners' meeting organizing the district, it was named Camas Cave mining district and the particular locality as Tyson. Tyson is about 1 mile west of the St. Maries river, 3 miles from Santo postoffice, 22 miles from St. Maries, at the confluence of the St. Joe and St. Maries rivers, and about 42 miles from Tekoa. There are two roads by which Tyson can be reached. One by the way of the O. R. & N. to Tekoa, and by conveyance from there to camp. The other is by way of Coeur d'Alene City, thence by boat over Lake Coeur d'Alene and up the St. Joe river to St. Maries and by stage 19 miles to Santo. The latter route is preferred by those who have passed over both roads.

LEMHI COUNTY.

Bausch and Deming have sold the Ore Cache group of mines to J. J. Cone of Canyon City, Colo. The group is on Carman creek and consists of ten quartz claims, eight placer claims and a 10-stamp mill. The ore is free milling, averaging from \$4 to \$6 per ton. The new management will continue operations and, if necessary, increase the capacity of the present plant. W. H. Robinson is superintending the work and R. Herndon is foreman in charge.

SHOSHONE COUNTY.

The Father Lode, near Sunset Peak, in the Coeur d'Alenes, has been sold to E. T. Le Clair of Minneapolis, Minn., C. G. Nielson of Sandusky, O., and associates.

MICHIGAN.

HOUGHTON COUNTY.

The Calumet & Hecla Co. is said to be introducing a policy of rigid economy. The company employs a large force of chemists and assayers constantly, and devotes one head of stamps at its mill to experimental work. In spite of all this approximately three-fourths of 1% mineral, or fifteen pounds to the ton, it is said is lost in tailings. This is more copper than is contained in the rock which is mined and treated at a profit by some of the other companies. The Kearsarge lode is supposed to outcrop near the eastern boundary and underlie the entire Calumet property. No attempt has yet been made to ascertain the value of this deposit. If it is as rich in this mine as in the Wolverine and Mohawk it will insure the Calumet & Hecla at least a century more of life.

MONTANA.

BEAVERHEAD COUNTY.

The Chrystal Graphite Co. of Kansas is developing a graphite mine near Dillon. P. Smith is president and has been superintending the work. The vein varies from 12 inches to 3 feet in width.

JEFFERSON COUNTY.

M. Bradley & Co. have bonded the Surprise mine to C. J. Pruett of Whitehall and S. R. Fair of Butte, who have erected machinery on the property preparatory to sinking.

Owsley & Prickett, who have a bond on the Baltimore copper group, have 11 feet of copper and silver ore and have shipped eight cars during the month. The shaft is only 40 feet deep.

LEWIS AND CLARKE COUNTY.

T. J. Connor is working on the 1200-foot tunnel on the Merrill group, which will have a depth of 350 feet at the face when

in the ore. Men have been employed for over a year in taking out water rights and ditches on the Little Blackfoot to provide power for the working plant. The plan is to build a ditch that will give several hundred feet fall, generate electrical power for transmission to a mill site at the mines, where a large mill capable of treating several hundred tons a day will be erected. This mill will probably have to be built on the Basin side, 2 or 3 miles down from the mine, and a narrow-gauge railroad built to connect the mines with the mill. The principal owners now are the McLures of St. Louis, F. A. Heinze of Butte, and J. Breen of Spokane.

MISSOULA COUNTY.

The Blue Wing M. Co. has incorporated at Wallace, with a capital stock of \$100,000, to work mines near Saltese. F. F. Johnson, H. J. Rossi and S. Seidenfeld of Wallace, Idaho; H. R. Allen of Spokane, Wash.; and F. Fichault of Saltese, Mont., are directors.

NEVADA.

HUMBOLDT COUNTY.

W. E. Lampson of Foltz has made a cyanide run of 210 tons of tailings from the old Bonanza mill. The tailings assay \$2.65 per ton, and Mr. Lampson reports extraction up to \$2.15 per ton. There are 3000 tons of tailings.

The U. S. Land Office at Carson is hearing a contest over the title of the Emmons iron mines near Lovelock. Mr. Emmons has worked these mines a number of years, but it appears that the claims are on odd numbered sections reserved for the railroad. The grant excludes mineral lands, except iron and coal. Mr. Emmons relies upon the showing that there are other minerals besides iron on the land.

LANDER COUNTY.

The mines of the New Pass M. Co. have been bonded by W. F. Snyder and associates of Salt Lake City, Utah. Under the option the syndicate undertakes to pay a purchase price of \$250,000.

WASHOE COUNTY.

The first steam hoist in Wedekind, Reno's mining suburb, has been started up. The hoist is of 80 H. P. and is over the new Bell shaft. A building is being erected over the machinery.

NEW MEXICO.

COLFAX COUNTY.

The Smithfield G. M. & M. Co. of Pittsburgh, Pa., operating on the Senate-Bobtail and Abe Lincoln, near Elizabethtown, have opened an 18-inch lead averaging over \$100 per ton, and are putting in new pumps preparatory to further sinking.

The Ohio M. & M. Co., M. Walsh manager, have 18 feet of ore which averages \$16 to the ton, on the Denver claim at Elizabethtown. Larger pumps are to be put in.

The Legal Tender M. & M. Co., O. F. Matkins manager, have renewed operations in Willow gulch near Elizabethtown.

GRANT COUNTY.

A copper strike on one of the Dorsey & Kowloon group of mines, adjoining the Houston & Thomas mine, Pinos Altos district, is reported. In crosscutting 12 feet at the 60-foot level a 36-inch vein was cut, averaging, it is said, 36% copper, malachite and native.

SANTA FE COUNTY.

The Santa Fe G. & C. M. Co., at San Pedro, is running smoothly; J. T. McLaughlin is Supt. The company owns at San Pedro its copper mines and also owns an iron mine to supply flux. Coke is brought from Colorado. The ore is brought from the mine over a gravity tramway. The plant cost over \$100,000. About 300 men are employed and the monthly pay roll is \$12,000. The smelter product is hauled to Ortiz station, about 18 miles.

OREGON.

BAKER COUNTY.

The North Pole mine, of which E. Melzer is manager and J. P. Fox superintendent, is situated on the northern section of the well-explored ore belt that runs through the Cracker Creek district, near Sumpter. The mine is well developed and produces a regular tonnage. It is opened through a system of tunnels which give a working depth of about 1000 feet on the vein. The lower or No. 1 tunnel cuts in on the strike of the vein 2200 feet. Tunnel No. 2 is 450 feet above No. 1 and cuts 1400 feet in the same direction. The two are connected by an upraise that starts in No. 1 at a point 1300 feet from the entrance. Near the breast of No. 2 an upraise leads to a blind level 100 feet above. The latter is 600 feet long. Near the northern extremity of the blind level an upraise of 170 feet opens into tunnel No. 3, the latter going in 900 feet. From No. 3 there are four upraises, 120 feet apart, which go to the surface, and between these raises the ore has been pretty thor-

oughly stoped out and milled. The stoping also extends to the other ground between No. 3 and the blind level. Above No. 3 the ores have been well oxidized and it is this class that has kept the mill going a number of years. On and below the blind level the ores are a sulphide of iron, carrying gold values, and from now on this class of ore will be mined and mixed with the oxides and milled. The ore will pass through the battery, resulting in slimes, fines and coarse product. The slimes, which result from the oxides, will pass to cyanide leaching tanks; the fines to the Wilfley tables and the coarse to a Huntington grinder. The slimes produced by the Huntington will also go to the cyanide vats, the coarse returning to the tables. By this method it is claimed 60% of the values are saved by cyanide and the balance in concentrates. The final table tailings, however, are recyanidated. The mill will now run seventy tons of ore per day.

South of the North Pole, some distance, is the E. & E. mine, which has been idle for two years, but which may resume operations this season. South of this is the Columbia group, in charge of F. S. Baillie. The 600-foot shaft here has been enlarged to three-compartment and a station pump set at the 500-foot level. The shaft is being sunk deeper. The Columbia 20-stamp mill, with plates and twenty Johnson vanners, is operating by water power on about seventy tons of ore per day. The object of so many tables is to effect numerous reconcentrations. The final mill tailings are passed to a tailing plant, where they are subjected to cyanide leaching. Of the gold values in the ore about 40% are saved on the plates. The concentrates run about 32% silica and 25% iron. Their concentrate values will run about \$350 per ton. The ores milled here are taken from below the line of oxidation, the oxides remaining in the upper levels.

The Golconda mine and mill, which adjoin the Columbia, are being operated, the management of which declining to give any information as to development, equipment or production.

Three miles southward, on apparently the same general zone, is the Mammoth group, developed by a 200-foot tunnel to the ore ledge, with several hundred feet of drifting on the latter in ore. This work shows the vein to be of considerable thickness, standing between a granite hanging wall and a slate foot wall. The ore, comprising an iron and arsenical sulphide, with considerable quartz bearing free gold, runs in shoots through a slate and decomposed granite gangue. The sulphides run heavy in iron and silica. The walls are inclined to swell and crush in the timbers. Stoping along the vein three sets high has extended 250 feet and two sets high for 80 feet in the opposite direction. A mill, equipped with crusher, Bryan grinder, plates and concentrators, is operating on about twenty-five tons of ore per day. N. K. Remington, mine foreman, states that about 80% of the saving is effected by amalgamation. The property is under the general management of H. S. McCallum. WASCOTT, Bourne, June 28.

Two prospectors have brought specimens of rock showing opal of all shades into Baker City. The rock is float, and besides opal carries gold in several places.

GRANT COUNTY.

The Gold Bug Grizzly, near Granite, is working fifteen men, putting in a hoist and developing the mine, preparatory to building a 10-stamp mill this season. J. Helberg of Spokane is associated with J. Hennessy, the superintendent, in the property.

F. Kelly, owner of the Reco mine in British Columbia, has bonded the Oro Grande claims, adjoining the Alamo mine, from M. Munroe, and also the Jack Martin group at Robinsonville.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The secretary and general manager of the Niagara Tin M. Co., with experts, are looking over their property, near Lead. The company owns eighty acres, through which tin-bearing ledges run. It is claimed that an average of 3% tin has been obtained by mill runs from some of the larger veins.

PENNINGTON COUNTY.

A 50-ton cyanide mill is projected at Deadwood for the treatment of the low-grade ores produced by mines owned by H. A. Wattson, F. D. Sanders, B. Rogers and J. Wattson. The latter is superintendent of the operations.

UTAH.

JUAB COUNTY.

The Centennial-Eureka employs 260 men at the mine and keeps up a steady record as a producer. In earlier years, when the product came from above the 400-foot level, the ores were mainly gold

and silver bearing, carrying a small percentage of iron and no copper; but from and including the fourth level downward they have become a copper and iron sulphide, carrying an average of 6½% copper, one ounce gold, thirty to forty ounces silver, 4% to 5% iron, 68% to 75% silica and about 1% sulphur. The lead values here are light. In shipments of 40,000 tons of ore only about 700 tons of lead have resulted. The shaft is 1600 feet deep, being 800 feet off the ore body. The ore is in a vertical fissure which stands about 90 feet between walls, though this is interrupted in places by the intrusion of country rock. As an illustration of the extent of the ore and the character of the work, it may be cited that in one stope between the fourth and fifth the chamber worked out is 250 feet long, 150 feet wide and about 100 feet high, and contains 2400 square sets. On the sixth level a new ore shoot was recently struck, wherein the ore runs high in gold, silver and iron, but low in copper. This shoot was 200 feet off from the main ore body, but running parallel with it.

On the main seventh a winze sinks 110 feet in ore to an intermediate level, connecting with a second winze that goes down 80 feet in the same ore shoot. The idea is to raise from the 10th and connect with these winzes. Ore is being taken from practically all the levels from the 200 down to the twelfth. Drifting proceeds from the twelfth and fourteenth for the ore bodies.

Centennial-Eureka ores have never been milled, the better grades having been shipped to the smelters. There are about 55,000 tons of \$20 ore on the dump that will doubtless be handled in the near future. Interest attaches to the Centennial-Eureka now to an unusual extent on account of its virtual consolidation with the U. S. group of Bingham, and the immediate prospect of the construction of a 1000-ton smelter to handle the ores from both groups. C. E. Allen is general manager of the Centennial-Eureka and R. A. Brown superintendent.

The May Day ships from two to four cars per week of first-grade ore to the smelter, reserving the lower grades for milling. The ore averages 12% lead, \$2 gold and fifteen ounces silver. The ore is partially oxidized, though a large per cent is sulphide. The mine is worked through a tunnel which goes in 900 feet, all the work in ore being below the tunnel level, this work including two or three winzes, one of which is 200 feet deep.

The May Day mill for dry concentration will soon be completed. It will comprise crushers, rotary drier, automatic feeders, fine crushers, rolls, Crown sizers, screens and Crown concentrators. There are ten Crown sizers made up of a system of screens having a revolving motion. These machines size from one to another. There are four of the concentrators. The plan of the concentration is to get the entire product down to a uniform degree of fineness, the lighter particles being carried away by currents of air, the heavier, which contain the values, being carried safely through the agitated medium and saved. It is the old idea of gravity, with air instead of water as a vehicle for carrying away the refuse. The construction is in charge of F. P. Hanson of the engineering firm of E. B. Rogers & Co. of San Francisco. The result of the operations of this mill will be watched with much interest.

EUREKA, June 24.

Jesse Knight has sold the Uncle Sam and neighboring claims on Godiva mountain, at Tintic, to the Uncle Sam-Humbog M. Co., for \$500,000.

SALT LAKE COUNTY.

The Park Valley G. M. Co. has incorporated; capital stock, \$5000. J. H. Featherstone is president, J. L. Perkes secretary and W. A. Byers treasurer of the company.

TOOELE COUNTY.

The Con. Mercur G. M. Co., Mercur, produced \$137,500 gold in May. During June there has been milled 28,000 tons of ore, or an average of over than 900 tons daily. The battery record shows a perceptible increase in the average value of the ore. At the Mercur mill at Manning 600 tons of tailings daily are being treated that average \$2.27 gross.

WASHINGTON.

The Forty-five mine, near Silverton, on the Monte Cristo Railroad, has been provided with an aerial tramway 13,800 feet long, which will soon be operating. The ores here are an iron and lead sulphide, carrying gold, silver and lead values.

The Sunset mine, near Index, has a surface tram line 6½ miles long, extending from the mine to the railroad. The development consists of a tunnel, with 300 feet of drifting on the vein. A new tunnel, 100 feet below that originally driven, is now being pushed in, which is expected to cut the ledge at a point 500 feet from the entrance and at a vertical depth of 350

feet. This property belongs to a company in which J. E. McManus & Son of Seattle are interested. It is stated that some months ago fourteen cars of ore from this mine were shipped that ran 9% copper and one car that ran 332 per ton. The ores are largely a bornite. It is asserted that 300,000 tons of ore are blocked out and that a concentrating mill will doubtless be erected.

The company owning the Ethel mine, in same locality, have decided to erect a concentrating mill on their property. Theirs is also a bornite and chalcopryite ore.

FERRY COUNTY.

The Congress mine on the south half of Collville reservation is a nickel mine. J. H. Hopkins, manager, says: "An assay from the No. 5 level ledge, 32½ feet wide, showed values of \$165 in nickel and cobalt. There is copper in the ore with the nickel, at times a large percentage."

OKANOGAN COUNTY.

The Washington & Great Northern Railway has been incorporated to build through the Okanogan valley to Republic. The incorporators are J. J. Hill, president of the Great Northern; T. Burke, W. H. Thompson, E. Sawyer and M. G. Grover, general counsel for the Great Northern. The new road will give railway transportation to Republic, Methow, Grand Forks, Loomis and Boundary creek. The road will be 250 miles long and cost \$9,000,000.

STEVENS COUNTY.

A discovery of a gold quartz ledge in the northeastern section has been made by E. E. Hall of Ione. A large number of men have been engaged opening a trail from the Pend d'Oreille river to the ledge—18 miles.

FOREIGN.

BRITISH COLUMBIA.

Mr. Graves of the Miner-Graves Syndicate is quoted as saying: "We are still looking into the refinery proposition. The first step on our part would be the construction of a smelter. After this was in good running order for, say, six months, we would have a better idea of the field for a refinery. I anticipate that the question of constructing the smelter at the coast will be determined within sixty days. In event of its being decided to go ahead with the smelter, a year would have to elapse before the enterprise could be completed and in thorough running order, and another six months would pass before we fully determined as to the refinery, so that the matter is very much in the future as yet."

Ore shipments from Rossland are beginning to be affected by the Northport trouble. All stopping and sorting has been stopped at the Le Roi, the Le Roi No. 2 and the Rossland-Great Western. The total output for week ending June 21 was 6695 tons and total for year to date 201,597 tons.

Among late discoveries in Cassier district is a sulphur mountain, situated on Hucklestone river, near Port Essington. It contains a large percentage of sulphur and carries some gold, copper and silver as well. The owners are J. Bryden, Mr. Swinnerton and some others of Port Essington, who say they are now filling orders for 60,000 tons of the ore. A tramway from the mine to the river is being constructed and flat-bottomed steamers will convey the ore down the Hucklestone to Port Essington, the shipping port.

NEW SOUTH WALES.

The return to the Department of Mines shows gold yield for April of \$425,000, as compared with \$270,000 for March. For the first four months of 1901 the yield is valued at \$1,400,000, as compared with \$2,150,000 for the corresponding period last year. The quantities and value of silver, copper, tin and coal exported from New South Wales during the first quarter of 1901 are:

	Quantity.	Value.
Silver, ingots and matte.....	123,519 ounces	\$70,000
Silver - lead and ores.....	101,895 75 tons	2,700,000
Copper, ingots, matte and ore..	1,713.6 "	550,000
Tin (ingots and ore).....	211.8 "	122,000
Coal, exported to foreign and intercolonial ports	830,351 "	1,960,000

This is an increase of \$570,000 over the corresponding period of 1900, coal being the principal item of increase.

QUEENSLAND.

The mining opal field at Opalton, in Western Queensland, has been restricted by the drought, only about thirty miners working. Some large blocks of very valuable opal have been found. Up to date the value of the opal mined in Queensland is estimated at \$1,250,000.

THE KLONDIKE.

John Doyle, formerly of Butte, Mont., who is mining 6 miles from White Horse in Yukon territory, writes that the district is very promising. He has four quartz claims through which a ledge 40 feet wide passes. The ore carries gold and copper, the latter predominating.

Commercial Paragraphs.

THE American Engineering Works of Chicago have closed a contract with the Modoc Mining Co. of New Mexico for their new concentrating plant, including crushers, rolls, screens, jigs and power plant.

C. O. BARTLETT & Co. of Cleveland, O., are erecting one of their special four compartment dryers for the Lakefield & Portland Cement Co., Lakefield, Ont., for drying 100 tons of coal per day. Also for the Wetter Steel Sand Co., Massillon, O., for drying 200 tons of sand per day. They are also in receipt of an order from the Diamond Wall Cement Co., Williamsport, Pa., and one from the Empire Cement Co., Warners, N. Y.

THE Stilwell-Bierce & Smith-Vaile Co., Dayton, Ohio, recently shipped one of their 27-inch improved cylinder gate Victor turbines, mounted on a horizontal shaft in a wrought iron flume, to the North Carolina Electrical Power Co., Marshall, N. C. The wheel was made entirely of bronze, and under 60 feet working head of water will develop 750 horse power. This power will be used for driving the plant of one of the street railways of Asheville, N. C. The shipment also included 70 feet of steel feeder pipe, three sets of headgate irons, and the necessary water rack.

THE New Process Raw Hide Co., Syracuse, N. Y., reports the export sales of its new process noiseless pinions as rapidly increasing. The company has shipped 100 electric railway pinions for G. E. 800 H. P. motors to London on an order from an electrical supply house in that city. The pinions are to be used on one of the big railways recently built there. A shipment of pinions has also been made to the Albion Motor Co., a big English automobile company. In the general machinery line the company has just shipped a number of big bevel gears, both iron and raw hide, some of the latter as large as 32" diameter, to a big English shipbuilding concern. A number of railway pinions have been shipped to Germany and Norway, and reports from those countries say that the demand for them is increasing. Several inquiries for catalogues and prices have lately been received from Japan. A good sized order is in process of construction for one of the mines at Kalgoorlie, Australia.

THE A. Merle Co. is the successor of the San Francisco Novelty & Plating Works, who occupied the building N.W. corner First and Mission Sts., San Francisco, for the past fifteen years, and known for the quality of their work and accuracy of weight of their silver-plated mining plates for saving gold. Their orders for mining plates and artistic metal work have increased within the last three years; they are now sending mining plates to mines and foundries in this country, Mexico, South America, Australia, British Columbia, China and Corea. They have built an extensive plant, fronting on Bay, Stockton and North Point streets, San Francisco, thus giving them a floor surface of over 80,000 square feet for the entire factory and over 8000 feet for plating plant. They also do all kinds of copper, nickel, brass and gold plating. They are able to furnish gold mines with silver-plated plates at lowest rates and guarantee weight. A visit to their office and show rooms, No. 515-519 Mission St., San Francisco, is invited. Visitors to their plating plant, with a permit from the office, will always be welcome.

FOLLOWING is an extract from a communication received by the Smooth-On Mfg. Co., Jersey City, N. J.: "Gentlemen:—Upon looking over your advertisement this morning it brought to mind a successful experiment on my part in the use of your Smooth-On Compound, the nature of which you have probably never known. I was at the time in the employ of the Virginia-Carolina Chemical Co. I had the Kehoe Iron Works here telegraph an order for twenty-five pounds. The experiment was this: In all fertilizer works they use what is called acid eggs (sulphuric acid) and the acid eats holes in them very rapidly. We had one that had been thrown away as no good on account of the holes and had ordered a new one, but it was delayed, and we were about to get into a hole and suffer quite a loss. Having used your compound several times for sand holes and fractures, I concluded that I could patch the old egg and save the company a few hundred dollars, so after receiving the can of compound I went to

work and fixed the old egg, and it is running to-day under sixty pounds pressure. This experiment happened about five months ago. The new egg has been laid aside for future use. The head chemist here said it would never do, so did two other chemists. They showed me by tests that the acid would eat it up. So it did in the dry state, but after mixing it with water and putting it on in the usual state and allowing the cement to metallize the acid had no effect upon it. Some of the holes were as large as your finger and clear through. Our chemist said that he had seen all kinds of ways tried to stop holes in acid eggs and that was the first time he had ever seen an egg used the second time. Yours truly, F. A. Lawyer, Chief Engineer, Savannah, Ga."

Personal.

W. H. W. HAMILTON of Sumpter, Or., goes on a ninety-day visit to England.

P. J. HICKEY, manager of the Ivanhoe mine in the Slocan, B. C., is in Spokane, Wash.

O. A. TURNER of Grass Valley, Cal., will manage the Tonopah mines, Nye county, Nev.

W. B. HANCOCK, manager of the Boston & Seven Devils Copper Co., Idaho, is in Portland, Or.

J. D. HUBBARD, metallurgist of the Ball mine, Siskiyou county, Cal., is sojourning in San Francisco.

E. P. JENNINGS of Salt Lake City, Utah, is in Canada examining a large mining proposition.

F. L. GARRISON, M. E., who has been in Boise, Idaho, for some time, has returned to Philadelphia, Pa.

THOMAS MARSHALL of the North Star mine, Grass Valley, Cal., has returned from an extended trip to Europe.

H. DE C. RICHARDS, manager of the Orleans Bar hydraulic mine in Humboldt county, Cal., is in Grass Valley, Cal.

JOSEPH GRAVELLI, late of Quartz, Tuolumne county, Cal., is now foreman of the Yellow Aster mill at Randsburg, Kern county, Cal.

W. R. ERSKINE, C. E., of Denver, Colo., is in San Francisco en route home from Ecuador, where he has been engaged in railroad construction.

WM. OGILVE, who recently resigned as Governor of Yukon Territory of Canada, has been offered the position as commissioner in the Alaska boundary dispute.

F. C. FENNER has retired from the management of the Lowell & Arizona C. M. & S. Co. mines at Bisbee, Arizona, with the transfer of the properties of that company to the Copper Queen M. Co., but will remain at Bisbee for some time.

Catalogues Received.

The Crane Co. have published a new edition of their list circular, giving dimensions of flanged and other fittings and gate valves. They have changed some of the measurements so that in ordering on pipe plans it is necessary to do so from the new edition, which they will be pleased to mail on request, of the main office in Chicago, Ill., or any of their many branches.

The San Francisco Oil Exchange Directory of the Pacific Coast has been published by the Charles W. Palm Co. of Los Angeles, Cal. It is an excellent up-to-date compilation of all the oil companies operating in California, maps and descriptions of districts, and digests and extracts of California, Arizona and U. S. laws affecting the industry. It will be found useful to those engaged in the industry.

The New York & Franklin Air Compressor Co. has issued a new catalogue, describing the latest types of the New York-Franklin air compressors, designed to provide air for the operation of pneumatic shop tools, mining, and other purposes. The catalogue is attractively illustrated and contains much valuable information relating to the structure and installation of air compressing machinery. It will be mailed on application to the New York & Franklin Air Compressor Co., 95 Liberty St., N. Y.

Recently Declared Mining Dividends.

Latest Market Reports.

SAN FRANCISCO, July 3, 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, nominal San Francisco, 47c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, \$16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £67 8s 9d per ton.

While the open quotations at New York remain unchanged, it is reported that a premium has been paid for spot delivery, some of the refineries being behind with the filling of orders.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.32½; San Francisco \$4.90, carload lots; 5½¢ 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½¢; pig, \$5.25. London, £12 5s 9d per ton—2.60 cents per lb.

SPELTZ.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton—3.58¢ cts. per lb.; San Francisco, ton lots, 5½¢; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, \$15.20; gray forge, \$14.25; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$25; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 30c; 1000 lbs., 30½¢; 500 lbs., 30½¢; less, 31c; bar tin, \$3.35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 per flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½¢; slab, 5½¢; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½¢.

PHOSPHORUS.—F. o. b. New York 50@60c per lb.

ASSAY LITHARGE.—San Francisco, 10c per lb. small lots.

BISMUTH.—New York, \$3.25 per lb., 50-lb lots; San Francisco, \$2.50 to \$2.75 per lb.

THE UNDERSIGNED, TRUSTEE IN BANKRUPTCY of Wolf & Zwicker Iron Works, bankrupt, is about to offer for sale the entire plant of that company, consisting of foundry, machine shop, pipe shop, boiler shop, blacksmith shop, and ship tools.

The plant comprises about three acres of land and the buildings thereon, situated in the city of Portland, Oregon, at the east end of the Madison Street bridge on Hawthorne avenue, East Water street, and having a frontage on the Willamette river.

Parties interested are invited to correspond with the trustee; will furnish full particulars, and inspection is invited.

H. G. PLATT,
Trustee in Bankruptcy, Wolf & Zwicker Iron Works, Bankrupt.

Address **ANDREW F. ROSENBERGER,**
P. O. Box 700. Nelson, British Columbia.

THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. **LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING.** A 1-inch stream will furnish ample water for a 50-ton per hour machine.
CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings.

The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from $\frac{1}{4}$ to $\frac{1}{2}$ greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

WHAT OTHER PEOPLE SAY.

The International M. & D. Co., Canton, O.

MATAPE, SONORA, MEXICO, April 23, 1901.

GENTLEMEN:—"Our machine is truly a 'Wonder.' It is without a question the greatest machine of the kind I have ever seen in all my 47 years' experience in placer mining. A number of times I have had the machine fed up to 20 tons per hour and have held my hand in the water so that I could feel the gravel as it passed along the bottom and over the rim of the pan, and the bottom of the pan was clear all the time, showing that we might have fed it much faster without fear of choking it. I have panned over a hundred pans from the tailings of our machine, and have not yet found a single color in them. The machine is correct in principle and is absolutely perfect as a gold saver. It saves the finest gold, even flour gold."

Respectfully,

T. E. ANDREWS.

ELKHORN, COLO., April 13, 1901.

GENTLEMEN:—"Your 'Wonder' Placer Machine is the greatest gold saver I have ever seen. One boy and myself are washing with the 18-inch, hand power machine, 2 tons of gravel per hour. I will commend your machines to all miners who want a first-class placer machine."

Respectfully,

A. Y. GORDON.

CALKINS' AUTOMATIC CUPEL MACHINE.

(PATENTED.)

BEGINNING COMPRESSION.

COMPRESSION.

EXPELLING CUPEL.

600 PERFECT CUPELS AN HOUR.

AN ARRANGEMENT of levers multiplies the amount of power, applied to the end of handle, twenty times, and the cupels made by this machine are perfectly homogeneous, giving greater power of absorption. The feed is entirely automatic, making the cupels of a uniform thickness; and they are expelled with a perfect edge. We make a table and a wall machine, employing the same principles but with a hand feed. These appliances are in use in all parts of the world and make perfect cupels.

"COAL HANDLING"

OUR NEW ILLUSTRATED BOOK SENT ON APPLICATION.
ROBINS CONVEYING BELT CO., 15-21 PARK ROW, NEW YORK.

United Verde Copper Mines, Jerome, Arizona.

Satisfactorily Roofed with P & B Ready Roofing

The Superintendent of the United Verde Copper Company, Jerome, Arizona, says:

"We have had your P & B Roofing on one of our buildings, which had a heavy sag in the center, for four years, was filled with water constantly from the exhaust steam, and flue dust from the smelter, making a combination of sulphuric acid on that roof. It never leaked a drop and when examined, the roofing material was found in perfect condition, showing me your roofing was all you have claimed for it. The works have been covered with P & B Roofing for eight years."

Here's a roof that is subjected to the most intense heat—from the sun above and the smelters below—yet it doesn't crack, scale or run.

Fumes from the smelter, steam from the exhaust pipes and smoke from the stacks have fallen and blown upon it for eight years. Yet it hasn't rotted or been injured in the slightest.

A roof that will stand this test ought to be good enough for anyone's building.

THE GRIFFIN THREE ROLLER ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

Nos. 38 to 44 Fremont St., San Francisco, Cal.

THE JEANESVILLE Miners' Sinking Pump

HAS THE FOLLOWING ADVANTAGES:

It is designed especially for the roughest and most exacting service.

It is particularly adapted for gritty water.

It is very strongly and yet compactly built, so as to occupy as small a space as possible.

It can be operated in any desired position, either vertical or horizontal.

This pump is an improvement in many ways over other makes of sinking pumps.

The cap under the Plunger is fastened with Hinge Bolts, one bolt retaining the cap after the rest are released. Also providing Priming Valves in the Water Valve Chest Cover to prime the Lower Valves from Column Pipe, and they are so close as to be in no danger of breaking off.

We have thickened, and thereby strengthened, the wall of water passage leading from lower end of plunger. We have also strengthened the form, without adding materially to the weight of the connecting piece opposite the water passage. These have been weak points in other sinkers.

All parts commonly made of brass, such as water valve seats, valve stems, valve springs, etc., are made of Phosphor Bronze.

All parts are made to gauge, so that they can be easily renewed.

Parts for repairs will interchange with Cameron Sinkers of the same size.

MORAN FLEXIBLE JOINTS.

Simple. Efficient. Durable.

All Metal Construction.

Positively Tight Under Any Pressure.

Applicable to Steam, Air, Water, Oil.

THE FULTON Variable Motion Continuous Flow PUMPS

are made in four sizes with capacities up to 30,000 gallons per hour. THE FULTON DOUBLE PLUNGER CYLINDERS to work in connection with them, in 20 different sizes and lengths.

THE FULTON SINGLE ACTING PUMPS are made in 25 different sizes and lengths. The Valves and working parts of both Single and Double Acting Fulton Pumps can be removed, repaired and replaced without disturbing either the Column Pipe or Cylinder. Send for Illustrated Catalogue.

Manufactured by **A. T. AMES, Galt, Cal.**

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and 1/4 inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

TREAT YOUR ORES,
SAVE YOUR VALUES.

CONCENTRATE
AND ...
AMALGAMATE

In substance at one operation
by the

Hooper
Pneumatic
System.

Four Space, 3x6 Ft. Weight, 2250 Lbs
Capacity, 10 to 50 Tons Daily.

WE USE NEITHER
WATER, CHEMICALS NOR QUICKSILVER.

Ores, etc., Treated:

Gold,	Copper,	Corundum,
Lead,	Chrome,	Antimony,
Zinc,	Nickel,	Cinnabar,
Mica,	Clays,	Black Sands,
Tin,	Garnet,	Any Sands,
Slags,	Graphite,	Mixed Ores,
Silver,	Fluor Spar,	Metallic Ores

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 68 Broad St., N. Y., says
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two
years' use am convinced it is the only machine
that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says
"Will do perfect work and save all the Gold, fine
or coarse, with proper usage. We save Gold read-
ily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Sam-
ples (concentrates) received and are finest work I
have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver
Treatment, Ft. Wayne, Ind., says: "That little
machine is a daisy. The fact that you readily
save values that float on water is to me the most
convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating
mixed, silty or rebellious ores. Zinc
and lead combinations handled in good
shape where all other processes had
failed.

THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1½ to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

FRONT VIEW OF THE

KENT DRY PULVERIZER.

Reduces the hardest ores, and makes best product for any treatment.
Combines best wearing qualities, economy of power and great capacity.
Runs 24 hours every day without stoppage for oiling, adjustment or repairs.

THE PNEUMATIC CYANIDE PROCESS CO., 306 Boston Bldg., Denver, Colo.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes: our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

THE GOLD AND SILVER EXTRACTION CO. OF AMERICA, LTD.

TESTING WORKS, 1716 BLAKE ST.

HOUSE
LIGHTS**

For houses not having gas or electric
light service, and for those that have,
but wish economy and independence.

Costs **\$4.00** Per Light
EACH LIGHT LASTS A
LIFETIME

Gives a steady light, brilliant as electricity,
and whiter. Exceeds any town gas service in
existence. No complications; nothing to get
out of order. Simple as A, B, C. Handy as a
"candle"—jets can be carried around anywhere
in the house. Gas cannot escape, like from the
town mains. No smell, no smoke and no dan-
ger, as with kerosene or gasoline. No accident
of any kind possible, and the whitest, steadiest
and richest light that is known.

ASSESSMENT NOTICES.

WILLIETTA MINING & MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of June, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 8, 206 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
FRANK E. CORDES, Secretary.
Office—Room 8, 206 Sansome street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of June, 1901, an assessment (No. 2) of ten (10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ALEX. GRANGER, Secretary.
Office—Room 223 Crocker Building, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of June, 1901, an assessment (No. 3) of ten (10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801 Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 801 Claus Spreckels Building, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of June, 1901, an assessment (No. 2) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

The Evolution of a Mining District.

It is ever a source of surprise, the average individual's conception of what mining is. The idea that it is one of the most exactly organized of industries, that its business is one of the most perfect expressions of the modern commercial idea, seems to be appreciated only by comparatively few of the people most intimately concerned in carrying it on. By the great majority it seems as if it would always be considered a great game of chance. In considering it, the business of mining is always subordinated to the chances of mining. Promises and hopes seem to rate higher with the mass of people than existing performance. The successes in the business of mining are the attractions which induce investment, not to imitation of them, but to chance. A mine that has been developed and its earning power determined becomes an investment proposition for income, and measurably has its value fixed by the amount of anticipated profits. There is no speculation in it. There is no chance by which a development of metal value will make the mine so much more desirable to another person that the speculative investor will be enabled to take profits at once out of that person's pocket, instead of waiting for the mine to produce it.

Naturally, mining to people who instinctively regard it as a form of legitimate gambling, is largely a game of follow the crowds. A mine in a new district is made a commercial success by the application to its development of business principles, judgment, technical skill, thrift and honesty. The extensions and the district become at once the scene of mining gambling activities. The mine future, built and paid for as described by the mine making the initial success, is discounted and sold for other mines while they are

Open Cut in the Leaking Vein, Kendall Mines, Fergus County, Montana.—(See Page 15.)

Leaching Tanks in Kendall Cyanide Mill, Fergus County, Montana.—(See Page 15.)

in the prospect stage from which they may never emerge. The crowd who follow, in reality buy what it was their hope to sell. In time—more or less, it may be years, or a lesser number of months—the buyers of the future know that they cannot realize it. That it was a game that they played at and lost, and not a business that failed, is rarely realized. Usually it is the mine and mining that is blamed, when in reality there was neither mine nor mining. A mining district is set back in genuine development and its real value ceases to be recognized with the wiping out of the speculative interest.

All mining districts have at one or other time passed through this stage of evolution. It seems as if waste and mistakes in mining are inevitable accompaniments of mining progress. True causes are rarely generally realized. It is easier to ascribe the effects to symptoms. Unwise legislation, high taxes, extravagant and incompetent management, swindling in sales of mines, inefficient labor, and labor and capital conflicts, are all charged as the fault from which has come a failure of mining in a district which at the beginning seemed inevitably destined to be a success of mining. These things may be all true, but they are not the causes of failure. They are the failure itself—the unclean things that breed in corruption. The cause was deeper—it was in the considering of the mines and mining as mere counters in a gamble, in the desire to get something for nothing or a very little, in the mental constitution which would not regard mining as a commercial business.

After all, though, the district still has the real mines. The business sense, honesty and commercial instinct which leads to success still exists and ever seeks its own. The reaction after a speculative fever is not death—it is a step in advance towards fortune.

STATE MINERALOGIST AUBURY of California has properly called attention to the unauthorized and improper use made by mining stock promoters of the title of his office. Neither he nor his assistants as such report on mines for private use. The assistants are all mining engineers of high professional attainments and personal repute. Their connection with the public office is a distinct public benefit, promoting mining as an industry. Their connection with the California State Mining Bureau, though, is usually incidental to the regular practice of their profession, and at the most takes but a few months of the year from their private practice. The use of their names to give a semi-official character to their private professional service is wholly unwarranted.

The dredging companies and owners of dredging lands in the vicinity of Oroville, Butte county, Cal., are objecting to the assessment made of their properties for taxation. The special objection is to the assessment valuation of the land, 2143 acres of which have been assessed at \$365,255, a sum very largely in excess of its cost. It is stated that the assessment of the entire tract was only \$15,000 before dredging was begun. It does not appear that lands other than those under actual exploitation are so taxed. There seems an equity that should be recognized. It would seem that in assessing for taxation such lands there should be taken into account the condition of the land and the means provided for working it. Land that has been worked out certainly has no value—as mining ground that should be taxable. If land that is being worked the year for which the assessment is made is worth \$175 an acre, which seems to be the average of value placed on all the land by the assessor, land that with the means provided cannot be worked till next year is worth less and should be assessed less. Land that cannot be worked for ten or twenty years or more to come should be graded in value on that basis. If it is to be held that the land is all alike in value, without reference to the time of its exploitation, then, equitably, every acre of possible land that can be supposed of profitable dredging value, even though it has no dredging machinery on it, must be assessed at the same figure or on the same basis. There is nothing in the suggestion of assessment valuation graded with reference to the period of probable working inconsistent with uniform values on agricultural lands. The production of the former is a deduction from capital which does not produce earning. The production of the latter is an earning which does not deduct anything from the capital.

The La Sal Basin, Utah, Smelting Organization.

Some of the mine owners of the La Sal Basin, San Juan county, Utah, are said to be organizing to build a smelter to reduce the ores of their mines. The report states that stock will be subscribed by the mine owners, and that bonds will be issued at par with a stock bonus. The smelter is to be built close to the mines, and to be connected with them by a rail line owned and operated as part of the smelter plant.

The enterprise is squarely in line with the business policy this paper has advocated for mine owners. Custom mills and smelters have their economic place in providing a means for the making of a mine from the raw material with the least risk to already created capital. The mine once made, the operation of it for profit is a commercial mining business, in the economy of which reduction of ore to a consumable metal is one of the details, and it should be accomplished at cost, in order to give to the mine the largest possible margin of profit over ore extraction costs. This involves, as a necessity, the ownership of the reduction plant by the ownership of the mine. The La Sal miners are, in a businesslike manner, combining their mines to support a single reduction plant, availing themselves of the direct economies of industrial centralization, and the indirect economy of limitation of the element of risk by making a minimum the capital investment in reduction plant for each separate mining operation. They are also providing for the unavoidable transportation of waste with the same economy of capital investment and operative cost.

A suggestion as to the manner and conditions of the proposed capital investment of the La Sal project is perhaps pertinent. The statement is to the effect that the stock is to be subscribed by the mine owners; that bonds are to be issued; that, as an inducement to buy the bonds, a bonus of stock is to be given. The latter is an element of possible ultimate weakness. It implies dividends on the stock, else the bonus has no value at all. Dividends give to the stock a premium, which makes its ownership more or less desirable, independent of the ownership of the mines, and the business then differs not in kind but only in degree and name from the custom smelter organization. Bonds are merely the evidence of borrowed capital, for which the plant is the real security. No bonus of stock should be given as a premium to the lender. If the debt has to be discounted, charge the discount to capital. The stock and capital paid in on it should, as near as possible, represent the respective ratios of ore tonnage anticipated to be supplied. It should not receive dividends; but the surplus earnings, after providing for the replacement of the borrowed capital, should be applied in part, and first, to what may be termed an insurance fund, to repay to stock subscribers their capital investment when their mines becoming worked out, cease to provide ore and their business interest in the smelter terminates: in part, and second, to a distribution pro rata for the tonnage severally supplied for any convenient time interval. In effect there would be the equivalent of dividends on stock, but it would be based on ore tonnage. It is assumed that the smelter costs charged against the ore would be, for business convenience and simplicity, something in excess of flat costs, so there would be a surplus for distribution.

The business effect of doing away with dividends on stock as such and distributing surplus, as suggested, would be the creation of a condition tending to keep the ore tonnage supply at its economic maximum, and thus the costs of reduction at their economic minimum. The insurance fund to replace the stock capital is the only possible tax, and only becomes a tax in the event of an unforeseeable mine failure before it has provided its estimated tonnage to the smelter. The stock, considered as suggested, becomes in fact the evidence of a loan of capital that does not bear interest.

The essence of the business organization of such enterprises as the projected La Salle Basin Smelter is to make the mine more surely profit-earning by eliminating the waste of the profit margin in paying a mere machine an earning for service. The smelter, jointly owned and operated, must be considered as to

profit earning exactly as if it was the appurtenance of a single mining operation. The capital in it should not be permitted to make earnings and pay dividends; but it should be regarded and treated as a machine of the mine, precisely and for example, as if it was capital invested in a hoisting engine. Smelting enterprises, conducted in the manner suggested solely as an appurtenant detail of the mines, cannot be absorbed into combinations that will in the end absorb the mines. On the contrary, they will give to the mines all the industrial advantages that such organizations have, without the surrender of individual control of the mines and the possible profits of mining.

THE announcement is made that township and sectional surveys are to be begun this summer in Alaska a hundred miles inland from Valdes. The reason of the particular selection of locality is not stated. Probably it has reference to the line of railroad projected from Valdes to Circle City on the Yukon, and to possible agricultural development when opened up. A district in which public land surveys would become more immediately an aid to development would be Prince of Wales Island. It is an extremely rich, undeveloped, mineral-bearing area, and rich in timber and fisheries. Among minerals, besides gold, silver, copper and lead, there are iron and coal, the latter of unproven quality as yet. The timber includes varieties adapted to paper pulp manufacture and other varieties suitable for furniture and cabinet work. The climate is mild, permitting effective work the year around. There are numerous opportunities for the cheap development of large water powers. There are many excellent harbors. The island is on the main inside route of all Alaska steamship travel. The natural resources and natural facilities exist for a great economic development, which a public land survey would both directly and indirectly assist—directly by making it possible to get the fee title to lands necessary for the exploitation, and indirectly by making officially known in detail the magnitude and availability of the natural wealth.

THE Pacific coast and mountain States should be the source of the metals and their manufactures exported to China, Siberia and eastern Asia generally. The advantage of distance and time of transportation is two to one in their favor. But two disadvantages have to be overcome, one industrial and the other commercial. The Pacific coast country does not yet produce iron or steel at all and manufactures very little of any metal into consumable export forms. Commercially, steamer freight rates from New York via the Suez canal to eastern Asiatic ports, two-thirds of the way around the world, are no more than freights across the Pacific only one-half the distance. The reason for this is that there are no return freights of consequence across the Pacific, so that the export traffic is compelled to pay the steamship earnings for the round trip. There is not sufficient population on the Pacific coast to consume any great quantity of return Asiatic production. The commercial disadvantage is, however, hardly as important as the industrial. Before the Pacific coast can become the source of metal exports to eastern Asia it must produce and manufacture iron and steel. For this both the raw materials and facilities exist. Only the disposition requires to be cultivated.

ALPINE COUNTY, CALIFORNIA, received a setback in mining development twenty-five years ago through the failure to realize extravagant expectations from some silver mines. The development was incidental to operations on the Comstock in the bonanza days, but could not stand the same methods of exploitation. Recent reports indicate that development is being resumed with gratifying success. Gold bearing quartz ledges, the existence of which might have been long since inferred from placers which could have had no other source, are being discovered. Some of the old abandoned mine openings are being successfully worked for gold where they failed operated for silver a quarter of a century ago. Of necessity what is so far done is very small—it is only a beginning—but it is suggestive of possible successful re-exploitation of long closed down mines, and the revival to old time population and activity of towns that have been mere survivals of names.

Concentrates.

A CYANIDE SOLUTION containing zinc cannot be successfully titrated by the iodide of potassium method.

THE total production of copper for 1900 was 486,084 tons, as compared with 472,244 tons in 1899. The United States produced 55% of the total.

THE use of a long wall machine cutting coal in a coal mine is reported to have resulted in 500 tons being undercut in one day at a cost of 2 cents a ton.

IN underground haulage in coal mines wire rope transmission is cheaper up to a radius of 1 mile, but with greater distances electricity becomes the cheaper.

THE decision of the Commissioner of the General Land Office of the U. S. is that mining locations without regard to mineral discovery constitute an occupation of the land.

THE costs of making iron at Sydney, Nova Scotia, are estimated: For 1.8 tons iron ore, \$1.80; 1.25 tons coke, \$1.80; .75 ton limestone, 40 cents; labor and incidentals, \$1.50. Total, \$5.50 a ton.

THE performance of all the acts required to make a valid location does not make a valid location when the law does not permit the location to be made. The right to make the location is the prerequisite condition to a valid mining location.

CERTAIN of the lately discovered rare elements, which are spontaneously luminous and produce and radiate electricity, are actually producing energy with no apparent source with which they could receive it, and appear to contain within themselves indefinite supplies of power.

THE wedges in timbering up to a working face should be driven toward the face, not from it. The impact of flying rock from blasting tightens the timbers in place if the wedges are driven toward it, but is likely to displace the timbers if the wedges are driven from the blasting direction.

REGARDING the use of water becoming a right of use appurtenant to land the Supreme Court of Oregon has decided that where the owner of a placer mine used water from a ditch owned by another party to work the mine, such use made the right to appropriate the water appurtenant to the land, and the right passed with the deed to the land.

THE arrastra is a fine grinder and amalgamator, but it cannot be hurried. It is not suitable for low-grade ores except that set tandem to a stamp mill to grind the tailings and it will save values that pass the stamp mill. With \$1 a ton in recoverable gold and free water power a battery of arrastras so employed will make a profit where cyaniding would not.

THE increase of temperature with the depth of the mine opening is not the same in different mines. The range of variation is considerable. As little gain as 1° Fahr. to 130 feet depth and as large a gain as 1° Fahr. to 34 feet have been recorded. Generally in estimating in advance of exact knowledge of the fact it is taken as being 1° Fahr. for every 60 feet.

PANNING is a fair means of finding out what is the concentratable matter in an ore, but the ease or reverse of ease with which the panning is effected is not a safe guide on which to determine the commercial concentratability of the ore. The personal equation, among other details, is too large an element in panning for its results to be considered conclusive.

TIN SCRAP is practically all made at the Pacific coast salmon canning plants during the few weeks immediately preceding the salmon canning season. Hundreds of tons of tin plate are turned into cans during this period. All of the plants are on water transportation routes. The scrap could be very cheaply saved and shipped to some central point, where a treatment plant could recover the tin and put the iron scrap into shape for economical utilization.

THE cost of mining hematite iron ore and loading it on ship board at Bell Island, Newfoundland, determined from three years operation, is 45 cents a ton. The cost of steamer transportation to Sydney, Nova Scotia, where the blast furnaces are located, is 45 cents a ton. The total cost of the ore, which contains 55% of iron, delivered at the furnace mouth, does not exceed \$1.25 a ton. The best result obtained with ores from Lake Superior is \$2.50 a ton.

THE customary practice in timbering mining shafts is to place the sets 5 feet apart between centers. In a vertical shaft the inside frame lines of the side and end plates should be exactly in line and plumb. Hangers, rods of $\frac{1}{2}$ inch or 1 inch diameter, with a hook at one end and threaded at the other, are used in couples on the side plates to draw the sets being put in, into place with the others. Wedges are employed in making the final tightening and exact adjustment.

A TRUE MERIDIAN can be obtained using a transit. The method is that of equal altitudes of the same star on each side of the meridian. The instrument is set up and the altitude is taken of a star several hours before it crosses the meridian. An equal altitude observation is taken of the same star after it has passed to the west of the meridian. During the time interval the star has passed over a horizontal angle shown by the reading on the transit plates. Make the verniers on the instrument correspond with the middle point of the reading, divid-

ing the angle in exact half, and the telescope will indicate the direction of the meridian, which can then be marked on the ground.

IN grading a water ditch it is not necessary to increase the grade on going around bends. A slight widening accomplishes the same purpose. The maximum grade that can be safely given depends on the quantity of water and the material in which the excavation is made. Some mining ditches in California that carry as much as 60 cubic feet per second are constructed in a red clay soil with grades up to 26 feet to the mile. Generally the grade should be such as to give a mean velocity of 3 or 4 feet per second.

A RECENT California decision relating to assessment work on a group of claims where the work was performed on one is that the question whether or not the work was of benefit to any or all of the claims could not be questioned, as a court could not be permitted to substitute its judgement as to the expediency of the methods employed for the development of a mine for that of the owner of the mine. The Interior Department has made rulings in hearings before it that are opposite to this decision.

MEXICAN labor cannot always be considered cheap. It is a mistake to figure that because men can be hired there for certain classes of work for 30 cents a day, the product of their labor will be correspondingly cheap. Cheapness is not regulated by what you pay, but by what you get for what you pay. The Mexican laborer is usually slow and as thoughtless of his employer's interests as he is improvident with regard to his own welfare. An American miner at \$3 per day is "cheaper" than a peon at 30 cents.

THE actual loss of copper in the processes of smelting and refining with good practice should not exceed five or six pounds to the ton of ore, about three-tenths of 1%. The smelter deduction of 1.3% is a custom which started in England and has been transplanted with the copper smelting industry. The smelters explain the practice now by the statement that the deduction is an indirect payment of smelting charges. That is to say, the charge for smelting would have to be made higher if the deduction was not made.

THREE eight-hour shifts cannot be employed economically in mine work. As a matter of fact, under the most favorable conditions as to clearance of powder smoke the working time of the shifts after taking out half an hour for lunch is not over seven hours. It is a question if miners do as much work in an eight-hour shift as in a nine-hour shift, it being argued that the work done in two nine-hour shifts is practically 90% of that done in three eight-hour shifts, so that the extra 10% is made at an addition to the labor cost of 50%.

THE usual diameter of steel employed for single hand drilling is $\frac{3}{4}$ inch. A more economical diameter is $\frac{1}{2}$ inch. Practically as much depth of hole can be drilled with the larger diameter as with the lesser. The economy of the larger steel is in the blacksmith work and in the gain of work done by the powder. The larger hole permits of the powder being placed nearer the bottom. It is found in practice that the larger diameter drills do not go to the blacksmith shop as frequently as the smaller ones when drilling in the same rock.

PAY STREAK in a placer mine refers to and is the name of the portion of the gold-bearing ground that will pay at least the flat costs of mining it, but not including the cost of dead work. The quantity of gold in the ground required to make a pay streak varies with the costs of mining. While not capable of technical expression by the same numerical equivalent in all mines, the term is in the commercial sense exact. Placer ground that, to mining on a commercial scale, does not yield sufficient gold to pay the commercial mining costs, is not a pay streak.

IN opening a blanket or lightly dipping deposit by a shaft where there is considerable water to be handled, the preferable point of location for the shaft is about the center of the ground it is proposed to work. The water in the portion of the ground which is below gravity drainage to the sump at the foot of the shaft is pumped to the sump, and the mine spoil from this area is hauled up to the foot of the shaft by cable traction or other convenient means. Measured against the total output of the ground there is a saving effected over the cost if the shaft be sunk to the deepest point of the deposit and water and spoil be all lifted direct to the surface.

A STRAIGHT-EDGE and "T" square can be employed to transfer with a high degree of accuracy a surface line into underground working through a vertical shaft in which the structure only permits a very short base line between the two suspended plumb lines, or where the conditions preclude the setting up of a surveying instrument over either of the points. The straight edge is fixed in the line of the plumbs so that the "T" square can be used with it to fix a new line at right angles, in a convenient position for the employment of the transit. The distances are, of course, measured and recorded exactly as if the transit was used in place of the simpler tools.

THE Supreme Court of Montana has decided that all mining claims patented, or merely locations, are taxable. With regard to the last the practice in different States has not been uniform, some States taxing, some imposing no tax, and some taxing the improvements. The practical difficulty involved in taxing them comes from the abandonment of the claims between the date of as-

essment and the date the tax is payable. The tax becomes delinquent and the location is sold after it has really ceased to exist. It may be relocated in the meantime and the result is a clouded title. The most satisfactory system of taxation of mining claims seems to be that applied in some of the California counties. The assessor assesses them as personal property and collects the tax at the time of assessment.

THERE are several methods of recording angular measurements in transit surveying. The method of deflection angles obtained by reversing the telescope of the transit from the back sight with the verniers clamped at the zero points, and then reading the angle turned to the right or left to make the new course, is a method practiced successfully and is simple in the field. In checking up the field books and platting it involves more labor and more chances of small error than the following described method: This consists in reading the angles in the field from the meridian or from a fixed base line. The verniers are then clamped for each back sight on the true reading of that line from the meridian or base and the reading is made from the zero points, which are thus each time put in the meridian or base line. There is a check in the field on error by the double reading given, and the checking of field books and platting are much simplified.

THE Stockton, Cal., U. S. Land Office recently made a decision on a contest for a quartz patent on land already patented as a placer mine, deciding against the quartz claimant on the fact that the quartz lode claimed was not known to exist at the time the placer patent was granted. The patent to the land in dispute was decided as vested absolutely by the placer patent in 1874. The quartz claimant did not initiate a contest until 1898. The first issue raised in the case, the right of a hearing to determine the fact, was decided on appeal, both by the Commissioner and Secretary of the Interior, favorable to the quartz claimant. Placer patents are, therefore, clearly regarded as subject to review and voidable if they improperly include lode deposits of minable value known at the date of application for the patent, regardless of the interval of time that may have elapsed since the issuance of the patent. It would seem that lodes known to be valuable at the time of application for patent are subject to location at any time, and controlled as to ownership and use by the mining statutes just exactly as if they were still on unpatented public land.

IN the practice of copper metallurgy in Germany wet methods of extraction are only employed where the ore is too low grade for dry process working. U. S. Consul General F. H. Mason, at Berlin, Germany, states that any owner of low-grade copper mines in the United States who wishes the opinion of German experts as to the best method of working them, and the approximate cost of necessary plant, can do so without expense by sending to the U. S. Consulate at Berlin ten-pound samples of the various ores produced by the same mine, together with full and precise information on the following points: Are the ores sulphides, oxides, or carbonates? What accessory minerals, as quartz, limestone, sand, etc., are at hand? What is the average run-of-mine percentage of copper, so far as known? What is the cost of labor per day? What is the cost per ton of coke or bituminous coal? How much ore should the proposed plant work per day? Is there an abundant water supply? What is the cost per ton of scrap iron? What is the cost per ton of sulphuric and muriatic acids? Mr. Mason says that with this information, and samples of all the grades and varieties of ores which can be combined for treatment, an experienced German mining engineer will make analyses and report which method, dry or wet, will be most effective, will submit estimates of the cost of a plant, and, if desired, will go to America to superintend its installation and initial workings.

IN shaft sinking, where the timbering is kept close up to the bottom, an excellent protection against the breaking or injuring of the timbers by flying rock from the blasting can be made of green pine or spruce poles. Each of the side plates is bored vertically with two holes near the ends, but inside the end plates, and where they will not interfere with the holes bored for the hangers. Two false side plates are made by splitting in half a green pine or spruce pole of a couple inches greater diameter than the thickness of the framed timbers. These plates are bored to correspond with the holes above described. Through the corresponding holes bolts are passed with the nuts and washers on top of the framed plates. These bolts act as suspenders and draw the false plates up till there is a space between of 7 or 8 inches. A floor of green pine poles 6 or 7 inches in diameter is then placed transversely with the shaft, the ends being held in the space left between the fixed side plates and the false plates, but not otherwise fastened. These short poles may floor the entire area during firing or may leave the hoist compartment clear, as the firing is done by battery or by fuse. While the men are working in the bottom of the shaft these short poles are stored on top of sets of timbers, out of the way. When a new set of timbers is put in the false side plates are released by removing the suspending bolts and lowered on the floor of the shaft till the new set is in place. The green timbers here suggested are not only much cheaper than the split or sawn lagging generally employed, but are a more complete protection and last longer than the dry lagging and sawn lumber spiked to the fixed sets. The green sticks are much less brash than the dry and resist impact better.

Genesis of Ore Deposits.

PART II.

Written for the MINING AND SCIENTIFIC PRESS by
MATT W. ALDERSON.

HOW TO FOLLOW PAY IN A MINE.—Let us forget, for the time being, all the theories of vein formation with which we have been made familiar. Let us walk along the banks of some stream. Let us note its peculiarities, so that if we find them somewhere else we will recognize them. We commence at the little rivulet, coming down from some precipitous hillside. We notice that it is a natural ground sluice—in other words, that the ground breaks down as one passes up the stream and the wash is carried below to fill up some lower place and make the bed of the stream more level. If the bed of the rivulet, therefore, be of mud or clay, we notice that the stream has gone down hill in little steps. We notice that the same is true of larger streams, only the signs are not so marked, because in them the water flows with less rapidity. The level places are of greater extent and the steps down are seldom observed except where there are rapids.

Let us notice the sides of the stream on a rocky bank. See the lines of fluting on the rocks, where they have been scored and striated by ice in the spring time. We notice the lines on the rock are always in the direction of the stream that made them, so that if we found similar effects on a rocky hillside, where there was no stream flowing below, we would instantly divine their cause. Let us walk out over a sand bar of the stream. Part of the surface of the bar is smooth, but in places we note evidences of the fact that water has formed over it V-shaped or corrugated troughs or depressions, some deep and some shallow—mostly the latter—and we note that these depressions extend lengthwise in the direction the water took in crossing the bar. Suppose we were unexpectedly set down on a large sand bar, where the river which made the bar could not be seen. We could tell the direction the stream had taken when forming the bar by noticing these depressions and the little steps down made here and there by the flowing water.

The mountain torrent moves rapidly, carrying oftentimes boulders of appreciable size, ground sluicing out the old bed and making a new one quite frequently. It takes the straightest possible course to the valley below. But in time the stream cuts its way into solid rock, which makes permanent rapids, and below these rapids there will be small flats, made by sediment washed down from higher levels. Few streams flow in a straight line. The small stream frequently makes very abrupt curves, regular zigzag lines, back and forth across a valley. The larger stream flows more quietly, in some places without a ripple on its surface. Generally the water has depth at such a place. In other places the stream flows more rapidly, the water passing over a riffle or down a cascade.

Now, we go into a mine, bearing in mind that quartz veins were made by just such streams as we have been looking at. Our first observation is to note the apparent course of the stream which made the deposit. Generally speaking, by noting the general course and direction of the pay shoot, itself, one may form a reasonably fair idea of the direction; for most pay shoots will be found to have their greatest lengths in the direction of the stream by which they were deposited. But we have a safer rule to follow than that. We have the corrugated surface—the lines of fluting and striation on the walls and in the clay gouge. These we may follow with absolute certainty, bearing in mind that no stream takes a straight course and that no two pay shoots are at all likely to be in direct line with a third. Where the pay shoots are large, we may expect the vein to pinch on the ends in the same manner as a flowing stream becomes shallow below a deep place, as it flows over a riffle, and after we have passed through the pinch we find another pay shoot—not, perhaps, in line with the first, but more likely on the other side of the channel, as we frequently find the deep holes in a river.

All mineral deposits were formed by streams flowing on the surface of the earth at the time the deposits were made. The secret of keeping in good ore and of following pay in a mine, therefore, comes from using judgment in reading the laws governing the deposit. These laws are as fixed and immutable as any of the other laws of Nature, and as susceptible of intelligent interpretation.

Fig. 1 is a representation of the ore shoot in the Fargo mine, Helena, Mont. It represents the ore body as if we were looking down upon it, the hanging wall being removed. This ore body is in limestone and is of the class denominated "pipe vein." It was, so far as we are able to judge, made by a stream which one could easily jump across—only a few feet in width. From A to B the ore body was 3 to 4 feet in width by 18 inches to 2 feet in thickness. From B to C the vein was wider and thicker, and from this place ore was shipped, one car going \$24 per ton and

another \$32. The ore mined was first reached at A by an upraise from G in a crosscut tunnel. The pipe was followed to B on a curve which turned back on itself completely for about 10 feet. Following upwards on an incline of about 30°, the pipe apparently pinched out and came to an end at C. There was a strong showing of ore on the surface at F, some 60 feet above C. But where was the connection and

FIG. 1.

how was one to find the lower end of the ore shoot which apexed at F? The formation above C was "drummy" and easily mined. The lay of the ore was such as to assure one that the original ore-forming stream had flowed more rapidly from B to C than it could from C to F. Theoretically, therefore, one should look for a larger body of ore in such a place, and—behold, there was none. On the theory that water couldn't flow up hill—couldn't rise above its source—the ore body couldn't be in the hanging wall, and the only probable place was in the foot wall. The upraise was continued, therefore, some 10 feet, bearing gradually out into the foot wall. No evidence of an ore body was found. The writer, in the knowledge of the correctness of the theory of vein formation of which this article is a partial elucidation, concluded some law governing the flowing of streams had been overlooked. He walked along the banks of a stream of the present day, seeking a situation analogous to the one in the mine. He was not long in finding it. Where the stream on the surface came down over rapids and reached a flat, it didn't go in a direct line to the lower end of the flat, but turned off at a right angle to one side, spreading out thin as it did so, and then, after flowing in this direction to the edge of the valley, turned down stream again and crossed the flat. Returning to the mine, it was noticed that there was a thin showing of ore to the right at C. It was about 1 inch in thickness, in a few places a little thicker. It had been given no attention because frequently there were little thin layers of quartz on either side of the pipe, which experience had proven amounted to nothing. But this layer of ore was taken up and followed, with the assurance that it would lead to an ore body. It was followed 18 feet to the right and at D opened out into a large pipe, which at E developed into a chamber of 20 feet in width and over 4 feet in thickness.

The most prominent and productive gold mines in Montana are at Marysville, the Drum Lummon, the Belmont, the Bald Butte, the Penobscot, the Empire, etc. The formation in this section is granite and slate. The presence of slate in conjunction with the ore bodies is a good sign, for, following the well-

FIG. 2.

known law of the sorting power of water and recognizing that slate is composed of the finer particles of sediment carried by a current, we know that the slate is a long distance from the original source, and

that the water which deposited it was comparatively still, a condition favorable to perfect precipitation, not only of the muddy sediments brought down by stream action, but to the precious metal contents of the fluid as well. Further, the ores are not base, the heavier sulphides having been, in all probability, precipitated long before the stream reached this level.

Fig. 2 is a cross-section representation of the upper levels of the Belmont mine. K is what is known as the main vein, L is known as the middle vein and M as the mud vein. N is a small ore shoot near the apex of the mountain. The veins are opened by an adit tunnel. M represents a point on the mud vein distant 60 feet from K. When pay was discovered in the mud vein fears were entertained, because of the pitch, that the apex would prove to be on adjoining property, but as the upraise was made it gradually curved over till it formed a cap to the middle and main veins and all were found to apex at O. This vein is classed by the owners as a complex fissure. In the light of this article, the stream which formed the ore bodies at Marysville was one of the large rivers of this section of the country when these deposits were made. The uplifting of the country tilted some of the veins—the Belmont and the Empire, for instance—on their sides, the Belmont having been tilted over so far that what was the top of the stream, and would ordinarily be the hanging wall, is in the greater part of the mine thus far developed the present foot wall. Other mines, again, such as the Penobscot, were set on end. It is more than probable that the Belmont and the Drum Lummon were originally lakelets. In any event, they were very deep, wide places in the channel. Turn Fig. 2 on its side. The mud vein was the original bottom of the stream. After ore formed on this bottom for some time an extra flood season brought down an unusual amount of sediment, filling the channel to the level at L, where more ore was formed. This was repeated and a new vein laid down at K. In the first part of this article I enunciated the law that the best ore will be more frequently found on what was the original hanging wall side of the vein, basing that conclusion on observations of veins themselves and of streams of the present time. The reason for such conclusion is well founded, in that the stream is apt to flow for the longest period in an undisturbed condition at the highest level it makes for itself, and that condition of calm, regular flow for length of time will favor the greater deposit of ore. This mine is an exemplification of this law, the ore bodies on the main vein being larger and richer than those in the other two.

(TO BE CONTINUED.)

At a recent meeting of the Paris Society of Civil Engineers, M. P. Besson gave some particulars of the commercial production of radium, which has been undertaken by the Societe Centrale de Produits Chimiques. Only about one-half ounce of the body can be obtained from one ton of the uranium minerals, which form the raw material, and the separation of this one-half ounce requires the expenditure of about six tons of chemicals, while fifty tons of water are used for washing purposes. M. Besson states that the activity of radium is such that it is spontaneously luminous in the dark. This luminescence does not arise like that of phosphorus from oxidation of the body, but is due to a continuous emission of electrified particles. The charge carried by these particles is enormous, but their mass is so small that the loss of weight is only about one milligramme in 100,000,000 years.

THE trolley has done much for the mining countries of the United States. Electric lines, catering to both passenger and freight traffic, are both popular and profitable. Interurban service in the Missouri-Kansas district is excellent, and in the minds of many mining men it is only a question of time until the lines become formidable competitors of the steam roads, owing to the ease and comparatively light expense with which switches and spurs can be constructed. Now the smelters in the vicinity of Denver have discovered that private trolley lines are so successful that several are preparing to equip their plants with trolley freight cars. Three cars, costing \$2000 each, will displace eighteen mules and two steam locomotives, besides the teamster bills, at the smelter which inaugurated the idea.—The Lead and Zinc News.

THE longest electric railroad in the world will be built from Cincinnati, Ohio, to Pontiac, Mich., a distance of about 305 miles, if present plans are carried out. The Everett-Moore Syndicate has obtained control of the Miami & Erie Transportation Company and the Detroit & Pontiac Railroad is extending its line 35 miles from Detroit. The consolidation of the Toledo & Detroit Shore Line and the Toledo & Short Line combined with the other roads of the Miami & Erie Transportation Company, gave the Everett-Moore Syndicate exclusive control of the field. The officers of the company are: W. H. Lamphrecht, president; W. S. Hayden, secretary, and Otto Miller, treasurer. It is estimated that the first division of the line between Cincinnati and Dayton will cost \$3,000,000 for the construction alone.

The Formation of Bonanzas in the Upper Portions of Gold Veins.*

NUMBER II.

BY T. A. RICKARD, DENVER, COLO.

The behavior of such gold ore under metallurgical treatment also suggests strongly that its usual mode of occurrence is analogous to the above example. When gold-bearing pyrite is treated by cyanidation, the gold may be leached out without deformation of the pyrite or any other change in its appearance except the acquisition by its facets of a pitted surface suggesting cavities left by the removal of a soluble constituent. Moreover, there are many mining districts yielding gold from pyritic veins in which the native metal is rarely seen. The ores of Gilpin county, in Colorado, for example, contain an average of from 10% to 15% of iron and copper pyrites; and I know from frequent trial that when crushed and washed in a pan, such material, even though very rich, will not yield a "color," that is, a speck of visible metallic gold. Nevertheless, in the stamp mill these ores yield their gold to amalgamation, indicating by their behavior in this respect that the gold is in a condition of such freedom as to permit its separation by a crude mechanical process, and its subsequent ready combination with mercury so as to form an amalgam.

The gold which occurs thus in the pyrite of the quartz vein is soluble in many natural reagents, some of which are formed in the very process of weathering which leaches the pyrite, while others are known to be present in the surface waters which circulate through the lode fractures under observation at the present day. By whatever means it is dissolved, the gold is then supposed to be carried by the surface waters in their descent toward the groundwater level, where it is precipitated under conditions to be discussed in due course.

SOLVENTS.—In the process of weathering, the pyrite yields many subordinate compounds, such as sulphuretted hydrogen, sulphurous and sulphuric acid, and proto- and sesqui-sulphates of iron. Of the latter, the sesqui-sulphate, $\text{Fe}_2(\text{SO}_4)_3$, is a solvent for gold, and has been cited by Wurtz and Le Conte in early discussions concerning the origin of masses of native gold in oxidized ores. Dr. Richard Pearce, in later years, has frequently drawn attention to the probability that this sesqui-sulphate is a factor in the process of gold deposition.

The gold deposits in the cavernous quartzite of Battle mountain, Colo., have characteristics which appear to confirm this view. In these ores large pieces of native gold, of a nuggety appearance, but really crystalline in structure, have been found associated with horn silver and the sesqui-sulphate of iron. The latter occurs in lumps, mixed with clay; and, although these are very rich in gold, the gold occurs in a form not to be detected by careful panning. Analyses of several lots of ore showed the presence of 12% of the hydrated sesqui-sulphate of iron.

But other solvents capable of doing this work, also occur in nature, and, although the amount of any of them to be detected in existing surface waters may be minute, we have to remember that the processes of nature are permitted so much more time than those of the laboratory that the dilution of the solution is compensated by the quantity of it.

Most writers refer to chlorine as a possible reagent. Such a reference is suggested not only because it is a prominent reagent in the metallurgical practice of to-day, but also by the fact that it has a wide distribution throughout nature in the form of common salt. This is most apparent in arid regions where evaporation causes concentrated solutions to be formed. Thus, in the deserts of West Australia the water encountered in the mines is always brackish, and frequently contains more salt than the sea. The water of the Great Boulder Proprietary mine, at Kalgoorlie, in 1897, contained 6402 grains of common salt per gallon. A considerable amount of magnesium chloride was also present. In some of the water used in the stamp mills, and obtained from temporary "lakes," the salts were present up to the point of saturation, and the liquid carried further salts in suspension, so that the amount reached as high as 30%, rendering the term "brine" more suitable than "water." This liquid contained 17% of salts in solution even when most diluted by recent rains, and it therefore afforded a parallel to the Dead Sea, the waters of which contain from 20% to 26% of salts, of which 10% is common salt. These excessive percentages are not due to the presence of deposits of salt in the rocks of the district, but simply to the concentration brought about by the excessive evaporation which takes place in a hot, arid climate.

Mine waters frequently contain a noteworthy quantity of chlorine, as chloride of sodium. At the Mammoth mine, in Pinal county, Ariz., the water carries five grains of salt per gallon, while the well water, used in the stamp mill, situated in the valley below the mine, contains twice as much. This would be equivalent to six grains of free chlorine per gallon. The larger amount contained in the water from the well, as compared with that in the drainage of the mine, suggests the results of surface leaching. Even

in mountainous districts, such as Cripple Creek, Colo., the mine waters carry chloride of sodium to a noteworthy extent. The water of the Independence mine contains three grains per gallon.

Another suggestive feature is afforded by the abundance of horn silver, or cerargyrite, the chloride of silver, throughout the dry tracts of Arizona, New Mexico and Nevada. Prof. Penrose emphasizes this interesting fact, and connects it with the bodies of salt water which still survive in places as "sinks" and "lakes." Furthermore, the oxichloride of copper, atacamite (which derives its name from the Atacama desert, between Chili and Peru), is frequent in these regions. Another and more uncommon mineral may also be mentioned in this connection. In the Mammoth mine, already cited, and in the well known Vulture mine, both in Arizona, the precious metals are associated with vanadinite, which contains chlorine as a chloro-vanadate of lead, $3\text{Pb}_2(\text{VO}_4)\text{PbCl}_2$. Thus the chlorides of copper, lead and silver are found in the oxidized ores of these regions, while the corresponding combination of gold is absent. The explanation is obvious. The chloride of gold is an unstable and readily soluble compound, while the minerals formed by the corresponding combination with the baser metals are comparatively insoluble in water, especially the chloride of silver, for the abundance of which there is therefore a good reason. It remains but to add that, in several Arizona mines which I have sampled, the ores above the water level carried a notable proportion of silver with very little gold, while in depth the silver contents have diminished and the gold has increased, especially in the vicinity of the water level.

Of the many reagents which would liberate the chlorine from salt, it is only necessary to mention ferric sulphate and sulphuric acid, both derived from the ordinary oxidization of pyrite. The hydrochloric acid thus formed would yield free chlorine in the presence of manganese oxides, which are very prevalent in the upper portions of gold lodes, in the form of the black earthy mineral, psilomelane.

There are other possible solvents, which need not be discussed here.

PRECIPITANTS.—Whatever the solvents which leach out the gold from the superficial portions of the vein, there is assuredly no lack of precipitants. It is probable that the gold does not migrate far before encountering conditions which compel deposition. Even when it is carried to a considerable distance it is most likely that such removal is effected by alternating stages of precipitation and solution.

Organic matter is a probable precipitant for the gold in such surface waters. It exists deeper than hasty observation would suggest. At the Great Boulder Main Reef mine, at Kalgoorlie, I saw the roots of trees which, in their energetic search for moisture, had attained a depth of 85 feet below the surface; and at the Sugar Loaf mine, near Kunanaling, also in West Australia, I saw a similar occurrence at a depth of 74 feet.

Another agency which, under certain chemical conditions, is a probable factor in reducing the gold from surface waters, is pyrite itself. Thus, the gold dissolved from the decomposed pyrite at the surface may be precipitated upon the unoxidized pyrite deeper down. Among the exhibits belonging to the Colorado Scientific Society is a bottle containing cubes of pyrite, on the faces of which crystals of gold are to be seen. They are the result of one of Mr. Pearce's experiments. The gold of a Cripple Creek ore was dissolved by using common salt, sulphuric acid and psilomelane as reagents, the chlorine being thus obtained in a manner analogous to conditions which probably occur in nature. This solution was placed in a small bottle, and to it were added a few large pure crystals of pyrite from the St. Louis mine, at Leadville. After several months the gold became precipitated in the manner described. In this connection the story of Daintree's experiment, which I have quoted before, is worth repeating. In 1871 Daintree commenced a series of experiments at Dr. Percy's laboratory at the Royal School of Mines, London. In a number of small bottles he placed a solution of chloride of gold, and to each he added a crystal of one of the common metallic sulphides, such as pyrite, blende, galena, etc. At the time when Daintree died, a few years later, no results could be discerned; but one of the bottles, containing the gold solution and a crystal of common pyrite, was removed to Dr. Percy's private laboratory, in Gloucester Crescent, and there, in 1885, the experiment was completed by the discovery of a cluster of minute crystals of gold upon the smooth surface of the pyrite. The experiment had occupied fifteen years; and on account of its very length it may be said to have more nearly approached the actual conditions occurring in nature.

In a case like that of the "Indicator," at Ballarat, it may be questioned whether it is the pyrite in the thin seam of graphitic slate or the carbonaceous matter of the latter which causes the precipitation of the gold. Even if the pyrite was the decisive factor, it must be remembered that it, in turn, probably owed its previous deposition to the action of the carbonaceous precipitant in the Indicator seam. This would apply also to the beds of black slate which have had so marked an influence on the occurrence of gold in the Gympie district, Queensland; but it

would not, I think, be applicable to the Rico deposits, where pyrite is not an especial constituent of the black shales, as compared with the sandstone beds of the same stratified series.

SOLUTION AND PRECIPITATION.—It is to be noted that in the two examples of ore-forming processes which have been considered, the gold in the superficial part of the vein is supposed, in one case, to remain in the gossan after the pyrite has been removed, while in the other instance the gold is also dissolved and carried elsewhere. This may appear contradictory. It is a good illustration of the perplexities arising from the application of chemical hypotheses to the theory of ore deposition.

Nature knows no interval of inaction; solution is going on at one time, precipitation at another. The gold is constantly the object of one or the other activity. After the pyrite is removed, or while it is still undergoing leaching, the gold is being dissolved, but more slowly than the baser metals. That which remains to enrich the gossan may well be supposed to be the survival from a larger quantity of gold which has been undergoing slow solution. The gold which was deposited deeper down from the surface waters may, as erosion takes away the upper part of the vein, eventually find itself close to the surface and undergo re-solution. It is a question whether the mining of to-day breaks in upon the gold deposits at one stage or another of a continuous process. The miner finds the balance of gold left on deposit from a current account in nature's bank. Solution and precipitation are everywhere in action; it is the excess of one or the other which determines formation of ores.

(TO BE CONTINUED.)

The Kendall Mines, Fergus County, Mont.*

Written for the MINING AND SCIENTIFIC PRESS.

The recent sale of the Kendall mines, situated in the North Moccasin mountains, Fergus county, Mont., has attracted much attention to those properties because of the large amount for which they were sold and the extensive ore bodies that have been exposed on them by development. What is now the Kendall mines were first located more than ten years ago by prospectors, but no ores of sufficient value to justify development were found at that time. Since then they have been located and allowed to go by default a number of times, until about two and a half years ago they came into the possession of C. Allen and others, who sold them to H. T. Kendall early in 1900 for the sum of \$2150, and thought they were doing well.

The Kendall group consists of two claims—the Klondike and Leaking lodes—and are situated on the eastern slope of the North Moccasin range about 20 miles north of Lewistown. Shortly after purchasing the properties Mr. Kendall erected a cyanide plant, a portion of which is shown by the illustration on the front page, having a daily capacity of a little more than seventy-five tons, and began development on the Leaking vein. The ore was at first extracted from a great open cut on the Leaking vein, illustrated on the front page, which exposed a body of ore more than 100 feet in width, carrying values, of from \$6 to \$8 per ton in gold. The mill was operated very profitably for several months on ores taken from this cut, and in November, 1900, a bond for six months was taken on the properties by Finch & Campbell of Spokane, and work was begun at once to verify the continuation and extent of the ore body. The bond named the price of the mine at \$450,000, and at the expiration of the bond the purchase was completed, and under the new management a thorough exploitation of the ore is being made. A tunnel being driven along the vein from the bottom of the open cut has penetrated the hill 450 feet with no change either in the value or the character of the ore, and several crosscuts from this tunnel have demonstrated the width of the vein to average equally as great as that exposed in the face of the open cut. A winze being sunk in the tunnel 350 feet from the entrance has reached a depth of 65 feet, showing ore all the way down. The bottom of this winze is 175 feet below the apex of the vein.

The ore is a contact deposit occurring between lime and porphyry walls, carrying a very small per cent of other minerals than gold. One shipment of bullion from the mill contained $\frac{1}{100}$ of 1% in silver, and this is about the average of the shipments thus far. The cost of extraction and reduction is less than \$1.50 per ton, as there is no waste matter, and the closest possible extraction is secured by the cyanide process, by reason of the ready susceptibility of the ores to that treatment. The present owners have this month organized a company known as the Kendall G. M. Co. for the purpose of operating and developing the properties. The new company is capitalized at \$2,500,000, and many extensive improvements are contemplated during the summer. A large electric plant will be installed to furnish power for mill and a pumping station, and a pipe line will be placed to convey water across the range from Warm Spring creek, 5 miles distant. It is also intended to replace the mill now in operation by an improved plant of the latest pattern having a daily capacity of 300 tons.

The Passing of Joseph Le Conte.

We doubt if the going hence of any other Californian would call for such breadth and depth of mourning as that which follows the departure of Dr. Joseph Le Conte of the University of California. His name is familiar wherever learning finds devotees. His works have commanded respect and admiration everywhere. His charming personality of mind and heart has endeared him to all. While still in full pos-

The Late Joseph Le Conte.

session of his great powers and fame his end came during a visit to the Yosemite valley last week. From amid the majestic mountains he knew and loved so well his spirit took its flight to the Creator's throne.

We are pleased to give our readers a glimpse of his beloved face and to pay our tribute of respect to his memory in words fitly chosen by two men able and fit to speak them:

"In the immediate presence of our great loss, it is Joseph Le Conte as the man, even more than Joseph Le Conte as the scholar, who is in our thought. To those who have known him, who have felt the touch of his rare personality, I must believe it will always remain so. His soul was clear as a crystal. His graciousness of manner was only the reflection of his inner life, which was grace and human kindness personified. A kindly human interest threw its robe over all the framework of his scientific life, and made him, with all his attainments and all his knowledge, a vital, living, loving, helpful human force. He dealt with the world of nature, but its lessons for the life of man, for the cleansing and uplifting of personal and social life, were of immediate importance to his thought. Many among the hundreds who have sat in his lecture room may forget what he taught, none will forget what he was. Even through the pages of his books shone out the warmth of his personality, for there was heart and the fire of life interest in every paragraph he wrote.

"For thirty-two years he has been a great vital power in the University of California. No man can estimate the value of the influence he has exerted. He has been always and everywhere for good and for every good thing. He has believed in the good and has looked for the good, and everywhere good has sprung up by his pathway to meet him. He wasted none of his time and strength in the depreciation of his fellow men. His students knew what he expected of them, and they answered to his faith.

"The habit of his thought was large and catholic. He saw clearly, because he saw in good perspective. He took many things into consideration when he framed a judgment, more things than it is given to men to see and know. It was because of this catholic range of his vision that he could not be narrow, and it was because his human sympathy reached to so many human lives that he could not be uncharitable. We shall not see his like again, but the memory of his life and his life relieved in those he has taught and touched will remain a unifying vital force in the institution to which he gave his best, and a blessing to the world."—BENJAMIN IDE WHEELER.

"The death of Dr. Joseph Le Conte removes one of the foremost thinkers and scientific men of the time—one whose writings and modes of thought have influenced the progress of science all over the civil-

ized world. Educated originally for the medical career, he thus acquired the foundations of the broad knowledge which later made him equally at home in the purely physical sciences and in the biological field. While his geological work is, perhaps, best known to the general American public, through the wide use made of his excellent books on that subject in universities, as well as in the secondary schools, his early and warm advocacy of the doctrine of evolution has probably served most to make him known and appreciated in the Old World, where he was always warmly welcomed and honored in scientific assemblies by the foremost men.

"It was he who first made the University of California known to the outside world as a school and center of science on the western border of the continent, and who kept it in view of the world of science, almost alone, for many years. His connection with it was largely instrumental in attracting to it other men, who otherwise would have hesitated to remove to what was then the outskirts of civilization from their Eastern homes; and his ceaseless scientific activity acted as a stimulus both to his colleagues and to the students under his instruction, whose affection and esteem remained with him through life.

"It is not easy to overestimate the influence he has exerted in rectifying the popular idea that the doctrine of evolution necessarily tends to materialism, if not atheism. So far from this, he regarded it as inculcating the highest ideal of a world plan, and he staunchly maintained not only its compatibility with religious belief, but that it offered a much higher point of view than could be derived from any of the orthodox doctrines by elevating nature into the realm of teleologic thought and aspiration. This part of his influence will, perhaps, be most missed in the present state of scientific thought. His death brings heavy loss not only to the University, but to the world of thought at large."—E. W. HILGARD.

The Labor Question in Rhodesia.

TO THE EDITOR:—This last six months the labor problem has been the burning question of the country. The labor boards, both in Salisbury and Bulawayo, have practically done nothing but discuss this question. First, the northeast coast native was the favorite and a trial consignment was ordered. On their arrival at Beira they first showed signs of having been deceived, which resulted in some of them being killed. On their arrival in Salisbury the same trouble arose, but, luckily, didn't go far and eventually the consignment was delivered. How they have fared since the newspapers do not tell. At any rate, it was thought best not to try another lot. Then arose the question of "Who next shall we try, as we have proclaimed to the world that the native labor question is the only thing that is retarding our mines, and unless we do something the English public will not keep on putting up the money for our salaries?" etc. The Indian coolie was produced, but didn't receive much encouragement. After him the "deluge" in the form of John Chinaman. This last is still being discussed, and, from all communications one sees in the papers, by people who have never had anything to do with him. While all this discussion is going on there is any amount of native unskilled labor laying around and only wants teaching to make it good. One of the great troubles with both mine managers and the so-called miners who have to handle this raw material is that they are looking for an article that isn't there and has to be made. They expect a "boy" to go below at once and be able to put in a 3-foot hole, never taking it into consideration that the "boy" most likely has never seen either a shaft, a drill or a hammer before in his life. The drill and hammer are put in his hands, he is shown where to put in his hole and told to go ahead, most likely in a language he doesn't understand, and the chances are that if he doesn't do the work in a "miner-like" style he is kicked and cuffed. In South Africa there are thousands of natives who know how and where to put in holes to the best advantage—indefinitely better than their white "boss." These "boys" must have been taught by some one, and the Rhodesians must do the same. Unfortunately, there are very few of them who can do it. The "boy" is an infinitely quicker learner than the average white man. You can with trouble teach a "boy" to be a good driller in a month's time, but it is doubtful if you could take an average "granger" or "yokel" and do the same. The nigger also learns very quickly when pay day ought to come round, and is just as keen as any white man about getting his money, and he soon finds out that drill "boys" get more than surface "boys." So long as a mine is fairly dry he very soon wants to go below and get more money. He is also shrewd enough to know at which mine he gets the most food and the least amount of kicks. He is also quick at "sizing" up his boss, and knows when he can loaf and when he has to work, and whenever he knows he has done wrong and gets punished for it takes it all in good part, but soon quits when it is the other way about. The principal things a manager has to see to, if he wants to get and keep "boys," are regular pay days, proper amount of food, fairly good accommodations and just treatment. The contractors—or at least some few

of them—and the so-called prospector are the principal culprits in causing the scarcity of labor. Directly a mine gets a bad name among the natives—and the natives are great talkers and travelers—it is goodbye for that mine. The one great trouble with the native is that he never will, however well he is treated, stay very long in any place. House "boys" are just as bad as mine "boys" in that way. Their wants are few and easily satisfied, and if the native could ever be educated to "want more" the labor difficulty would be nearly solved. Now, as soon as he has enough money to pay his hut tax and buy a wife he is perfectly satisfied, as a blanket and a few yards of "limbo" are all the clothes he wants.

MINING ENGINEER.

Gadzenia, Rhodesia, S. A., May 20.

Powell's New Throttle Valve.

Herewith is illustrated a new departure in construction of lever throttle valve which has just been placed on the market by the William Powell Company, Cincinnati, Ohio, who claim as points of superior excellency of the valve that it closes tight when the lever is moved full stroke and the valve shut; that it will not leak; the construction is such that it opens with ease under pressure; and that the slightest movement of the lever releases the disk, the wedge is withdrawn, while the disks are still at rest, equalizing the pressure so as to make a further movement of the lever without any effort. This con-

struction, especially in the larger size, dispenses with the by-pass. The valve is also warranted not to stick or jamb. The construction is such that they are very durable. They can also readily be repaired as all the parts are made to gauge and readily interchangeable.

A is the body or shell, B is the spindle, C is the carrier, terminating in a tapering wedge D, F-F are two links loosely coupled to the carrier at its upper end, while the lower ends of the links engage the studs of the disks E-E. The wedge D gets in its work upon the disk studs only as the rotation of the spindle reaches a dead center in the downward stroke. The reverse movement of the carrier, it will be noted, first lifts the wedge from between the disks before the latter begin to move, then, as the disks fall lightly away from their seats, they are carried up to full opening, absolutely without friction on the seats.

Mining and Metallurgical Patents.

Patents Issued July 2, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

COMPRESSOR.—No. 677,503; W. J. Francke, New Brunswick, N. J.

The combination with piston, cylinder, an annular suction valve port and discharge valve port in cylinder head, and discharge valve, of an open-ended sleeve valve surrounding piston and operated by friction thereof to control suction port, a closed annular cushioning-chamber between adjacent walls of sleeve and cylinder to cushion return movement of sleeve, an oil separator, a pipe connecting separator with discharge side of cylinder head, an oil pipe leading from separator to cushioning chamber, and a reducing valve in oil pipe and having controlling means whereby pressure exerted in cushioning chamber on sleeve valve may be increased beyond suction pressure under which machine is operated and thereby to close suction sleeve valve.

ROASTING FURNACE.—No. 677,510; B. Hall, Nevada City, Cal.

A chamber having stirrers or scrapers adapted to move over floor of furnace, tracks parallel with and exterior to furnace, trucks or carriages mounted and movable upon tracks, arms connecting exterior trucks with interior stirrers, troughs or channels between trucks and furnace chamber containing a substance which will form a seal, and plates centrally disposed with reference to troughs and dipping into contained substance, arms connecting carriage with stirrers being bent so as to dip into substance in troughs, whereby a seal is effected.

APPARATUS FOR THE TREATMENT OF ORES.—No. 677,614; J. Armstrong, Ealing, England.

A grate capable of holding considerable thickness of fuel, charging hopper for supplying fuel without admission of air, a bridge, a deep hopper having an opening at bottom beyond bridge for admission of pulverulent charge with smallest practicable quantity of air, a working hearth, a sump beyond working hearth, draft flues beyond sump, and working door beyond draft flues whereby air is prevented from entering either at the sump, working hole, or charging orifice in deleterious quantities, as any air seeking to enter door escapes through draft flues in-

stead of entering furnace in direction contrary to draft and uncombined oxygen is kept from entering at grate or fuel entrance.

APPARATUS FOR GOLD MINING.—No. 677,560; M. Covel, Chicago, Ill.

An ore washer to be located on beach in position to utilize wave action, and comprising a table bed, on which gold-bearing earth is deposited, a riffle frame, located one step lower than bed and a reversible fabric pad, located in turn a step lower than riffle frame and all joined together edgewise and adapted to receive the wave action endwise.

ORE_BUCKET DUMPER AND CHUTE.—No. 677,537; L. Collier, Cripple Creek, Colo.

A fixed chute section, a chute section pivoted to fixed section at its rear end, the pivoted section having a notch in free end, bucket having button attached to and suspended from bottom, connecting medium for button being adapted to engage in notch, to hold bucket while being dumped into fixed chute section.

EXCAVATING AND GOLD SAVING APPARATUS.—No. 677,844; J. C. des Granges, San Francisco, Cal.

A truck, turntable revolvably mounted thereon, sluice box stationarily supported upon truck, excavator mounted upon turntable, excavator comprising traveling buckets and support therefor, and chute also mounted on turntable, buckets at upper end of excavator discharging into chute and chute discharging into sluice box, support and chute vibrating parallel with each other about horizontal axes.

ORE ROASTING FURNACE.—No. 677,701; J. Roger, Denver, Colo.

In an ore roasting furnace, roasting hearth and feed screw located below and coextensive with hearth transversely thereof, feed screw being tapered from ore receiving end toward opposite end.

PULVERIZING MILL.—No. 677,702; W. M. Russell and F. P. Bixon, New York, N. Y.

Vertical imperforate casing which expands gradually downward and inner walls of which are straight, casing having inlet at upper part and outlet at lower part, vertically disposed shaft journaled in casing, arms extending from shaft in groups or series, arms of one group or series being shorter than those of group or series next below, bats carried by arms, bats of one group or series being nearer shaft than those of series next below, and obstructions within casing located between groups or series of arms and above upper group or series, outer surface or periphery of one obstruction being nearer shaft than that of obstruction next below and also within plane of the bats next below and at distance from walls of casing, whereby material passing downward through casing is caused to move outward and away from shaft.

FEEDER FOR STAMP MILLS.—No. 677,795; A. C. Pratt, San Francisco, Cal.

The feed spout hinged thereto and having outer end vertically adjustable and spring-supported, dropper spout having movable hinge connection at rear end to feed spout, and front end vertically adjustable and spring-supported independently of feed spout lever connection from stamp rod to movable hinge of dropper spout, and means for adjusting hinged position of dropper spout.

A GERMAN IMPERIAL COMMISSION, which has been experimenting with coal dust in furnaces, in a recent report specially mentions the Schwarzkopf apparatus. In the operation of this it is stated that it is necessary, in the first place, to have a highly heated fire chamber for the ignition of the coal dust, for, the higher the temperature, the quicker and more perfect will be the combustion. Contact with the boiler walls must be guarded against, as this interferes with ignition; the fire chamber must be lined with fireproof material, as it has to be kept constantly at a fixed temperature. It is pointed out that such a fire chamber is not an inconvenience, but rather a special advantage in coal-dust firing, because it insures perfect combustion, a high temperature of the gases at the start, and protection against the formation of "needle" flames. Also, after firing has ceased—for the night, for instance—the heat stored in the fireproof walls maintains steam pressure longer and steam is more quickly raised in the morning.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

COOKS INLET.

C. C. Weathersfield is said to have taken out \$200,000 recovered from his mines in the Turnagain Arm district. He reports that a great strike had been made on Bear creek, \$150,000, it is stated, being taken out of one pocket, and in speaking of the district said: "There were a great many new strikes made last fall on streams supposed to contain no gold but which are now paying very well, running from \$3 to \$5 per yard and more. There was picked up on Crow creek an \$84 nugget.

KETCHIKAN.

The Alaska Copper Co., Judge Mellen, Juneau, manager, and C. F. Reynolds Supt., has shipped forty tons of ore from Copper mountain, Prince of Wales island. The two trams are working perfectly. R. H. Gibson, foreman, has finished the ore bunkers and is running the sawmill. Work has been temporarily suspended in the 400-foot tunnel and the crew moved on top of the mountain to do surface work.

NOME.

N. B. Solner, manager of the Bank of Nome, says that he has bought \$100,000 worth of gold dust during the winter taken out by pan and rocker. Reports from Council City and Topkok state that the spring cleanup will approximate a half million dollars. From prospecting already done in the Bluestone and Kougak districts there will be numerous rich gold bearing creeks developed during the coming summer. In the Bluestone district, Gold Run and Adler are known to be very rich. Litigation, it is anticipated, will retard the growth of this district, owing to claim jumping.

PORCUPINE.

J. F. Malony, Juneau, who has just returned from Porcupine, says: "The Mix Bros. are taking out all the way from \$500 to \$1350 a day, working two men on each shift. Wiley & Finley have five men at work and are taking out from \$300 to \$500 a day. On Discovery, worked by Dalton and myself, we took \$2000 out of a space on the bedrock 10 feet square. We have twenty-five men at work. Ross & Smith, on No. 1 below are taking out a great deal of dust. On No. 2 below, Misam and his partner are sinking a shaft. There are a number of men working on the benches taking out dust in good quantities. On McKinley they are just opening up. Everybody in the district is immensely pleased with the outlook."

YUKON.

A strike is reported on Trail creek, a tributary of the left fork of the Chandelar river in the Koyukuk, made a year ago, but the secret guarded by the discoverers and those interested until now. According to the latest reports received it is a big payer.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence).—The Copper Glance M. Co. is 7 miles southeast from Bisbee, on the new Arizona & Southwestern Railroad. The officers visited the property on the 6th to select a site for the sinking of a double-compartment shaft.

Bisbee, July 7.

A report from Dragoon states shaft No. 1 on the Copper Chief claim was down 235 feet, and that the Copper Queen tunnel was in 65 feet. Also that the owners and the Copper Crown of Arizona Co. will put in additional machinery. The new railroad to be built from Cochise, Ariz., to La Cananea, Sonora, Mex., will pass near the properties.

GRAHAM COUNTY.

The Home Copper Co. organized at Morenci by electing J. H. Belton president, R. H. Waugh secretary and treasurer, and J. Moldor Supt. The company own a group of thirty claims and a mill site on Eagle creek, Morenci district, with considerable development work on some of the claims. A new whim has been put on the main shaft of the Peacock, now down 125 feet.

CALIFORNIA.

ALPINE COUNTY.

G. Monroe is reported to have made a rich quartz-gold strike in the Mogul mining district, under an old coal pit, surrounded by abandoned prospect holes.

BUTTE COUNTY.

The Wagner mine, at Morris Ravine, near Oroville, has been bought by the Sunset M. Co. of San Francisco. The mine will be re-equipped with an electric hoist.

The Supt. will be I. A. Pease. The mine will be re-christened Old Glory.

EL DORADO COUNTY.

The new 20-stamp mill at the River Hill mine, Placerville, is completed and the new hoist is being put in, to which will be added a new compressor and dynamo. Development work has been started on the Lucky Star mine on Poverty Point.

GLENN COUNTY.

A copper deposit on Stony creek is to be opened up on a working bond.

MARIPOSA COUNTY.

The Merced G. M. Co. has not as yet planned to increase the milling capacity. Shaft is down to the 1200-foot level.

NEVADA COUNTY.

A. J. McCuskel of San Francisco, Supt. of the Golden Treasure mine, at Grass Valley, states that under his direction the mine will be fully prospected. It adjoins the W. Y. O. D. and is owned by the California Construction Co.

PLACER COUNTY.

The Sailor Canyon Gravel M. Co., W. Duffey Supt., has opened the channel 800 feet in by an upraise of 16 feet.

E. M. Armstrong is manager of a company developing the Blue Hill gravel mine at Canada Hill. A channel 120 feet in width with good gravel has been prospected through an incline and a 1600-foot tunnel is being run to open it up.

The Canada Hill Gravel M. Co. has thirty men working on a channel 60 feet wide. The tunnel is in 1600 feet. The mill is running steadily. A reservoir will be built this summer on Robinson Flat. The estimated cost is \$10,000. R. Jones is Supt.

The compressed air power plant at Red Point mine is operating successfully. The Red Point Co. is now mining gravel 3 miles underground from the mouth of the main tunnel. An average of 120 cars of gravel are taken out daily in trains of sixteen carloads. The gravel is all free-washing. J. A. Ferguson is Supt. and seventy men are employed.

R. J. Trimble, Supt. of the Southern Cross quartz mine, near Towle, expects to have a new 10-stamp mill installed within the next sixty days. A 4-foot ledge of rich quartz has been opened for stopping.

A tunnel at the Central quartz mine, in Humboldt canyon, near the Pioneer, is being run to cut the vein 400 feet deeper than the present workings. It is expected the ledge will be reached by running 40 feet more.

SAN BERNARDINO COUNTY.

From the Buckeye, at Ludlow, ore is being shipped to the Barstow reduction works. On the west end several open cuts show a body of ore fully 40 feet across. Contracts have been let for the development of water, which if successfully developed thirty stamps of the mill will be removed from Barstow to the mine.

Four men are doing development work on the Roosevelt claims adjoining the Buckeye on the same ledge.

It is reported that the Rose gold mine, 55 miles east of Victor, has been bonded to H. B. Starbird, who has started work. The dump of tailings will be cyanided.

The 40-stamp mill of the Gold Mountain M. Co. is making regular bullion shipments.

W. L. Malone, president of the Bullion G. M. & M. Co. of Ontario, says a good streak of pay ore had been struck in the company's Mother Lode mine out on the desert, at a depth of 125 feet.

The pipe line put in by the Brooklyn M. Co. at Dale is said to be a success, and sufficient water is delivered to keep the O. K. and Brooklyn mills running continuously.

SHASTA COUNTY.

Capt. J. R. De Lamar has bonded the Arps group of fifteen claims near Copper City from W. Arps, R. M. Saeltzer, J. Kahny and A. Jaegel for \$75,000. He has also bonded the Michigan group of four claims, adjoining the Bully Hill mine, from J. Connors of St. Ignace, Mich., for \$25,000.

The original Bullychoop mine and the Cleveland Con., which adjoin each other on the line between Shasta and Trinity counties, are reported about to be sold at a price said to be in the neighborhood of half a million. The present owners of the Bullychoop, of which J. S. Childs is manager, may buy the Cleveland. But report has it that both mines will be sold outright to another Eastern company. These properties are big low-grade gold mines. The Cleveland, which was last worked by W. R. Beale under a bond in the sum of \$250,000, is owned by C. Foster of Corning, the Hart estate and others. The Bullychoop, which J. S. Childs bought for his company two years ago, has been worked and paid steadily. A 10-stamp mill is now running on ore from a 30-foot vein upened up by tunnel for 450 feet. The ore is said to run from \$5 to \$6 per ton. The monthly output of the mine is \$5000 or \$6000.—Sublett's Texas Jack claim, ad-

joining the Bullychoop, with five men and a 3-stamp mill, made a cleanup for May of \$1750.

The claims of H. C. McClure, at De Lamar, have been bonded for \$55,000. He owns four claims and 160 acres of railroad land, and nearly all the stock of the Pioneer M. Co., which owns four more claims. C. D. Porter, representing Washington people, has the option, which is for one year, payment being made on account.

SIERRA COUNTY.

W. Zuver of Auburn and the Messrs. Charters of Cleveland, O., are developing a copper mine near Downieville. At present 100 tons of ore are being shipped to the smelting works.

SISKIYOU COUNTY.

The Yreka M. & M. Co. is operating the Ball mine, near Rollin. The water season ended June 24th and the mill was closed down. During the season 5800 tons of ore were crushed, producing a little over \$60,000, including gold in 100 tons of sulphurets. The company intends to work men developing the mine and taking out ore for the next water season. The vein in the main shaft is developed about 130 feet in length, averages from 3 to 4 feet in width, and mills \$50 a ton. The company intends to install an assay office and canvas plant for sulphurets before next season's run.

At the Black Bear they are sinking the main shaft and the work is progressing satisfactorily.

At the Welker & Banche, adjoining the Ball mine, the arrastra has been shut down for the season on account of power giving out.

The placer mines in Sawyer's Bar and on the Salmon river are all being worked.

The dredger boat at Callahans is completed and the pit is full of water for floating it; the machinery is now on the ground and it is expected that the dredger will start in August. M. F. H.

Yreka, July 7.

TRINITY COUNTY.

H. Z. Osborne of Los Angeles and his partners, who bought the Lawrence mine on Coffee creek, near Carville, in the last week of June, are said to have taken out gold equal to the price they paid, the mine having been producing \$2500 per day from a rich seam. G. L. Carr, who owns the adjoining Yellow Rose of Texas mine, is sinking to find ore similar to the strike in the Lawrence at the same depth.

C. D. Galvin, manager of the Galvin dredger, Weaverville, has bonded, located and bought 1700 acres of what he believes to be the same channel, reaching from the southern boundary of the Sweepstake to the Trinity river.

F. Hall and R. J. Anderson of the Sweepstake Co. have bonded the Humboldt P. M. Co.'s holdings on Buckeye and have located 4160 acres additional, securing all the hitherto vacant mineral ground from Rush creek to Stewart's Fork—the up-stream extension of the Sweepstake channel, it is believed.

TUOLUMNE COUNTY.

F. Plummer and partner have taken out over \$1000 worth of gold from the Telephone mine, recently located by them, near Carters.

The Tazny pocket mine, near Sonora, is being operated under lease by Birney, Munroe & Co.

A rich strike has been made in the Sugarman pocket mine, on Bald mountain, near Sonora. The mine is owned by J. H. Neal, but worked under lease by Smith, Watson & Herold.

Thirty men are employed at the Republican mine, Sonora, under Supt. McGovern, crosscutting, drifting and stopping on the second, third and fourth levels. The 10-stamp mill is running.

Dondero & Son of Yankee Hill, near Columbia, have made a partial clean-up at their gravel claim after a seventy days' run. The head box and 100 feet of flume produced gold valued at from \$22,000 to \$25,000.

J. V. Loney, foreman of the Grand View gravel mine, Montezuma, says the company is driving a tunnel, now in 140 feet, under Table mountain. They have 20 inches of pay gravel in the face which goes \$2.50 to the car.

COLORADO.

The Dorcas mill at Florence has made contracts with Cripple Creek mines for all the ore it can treat, about 100 tons a day. The Dorcas is not in the new combination.

BOULDER COUNTY.

The Caribou mine dump at Caribou is being negotiated on lease. It contains about 500,000 tons and is one of the largest in the State, and accumulated at a time when the mining value of shipping ore was \$80 per ton. The property is part of the estate of the late R. G. Dun of New York.

CHAFFEE COUNTY.

J. D. Spellman, of Rutland, Vt., and E.

D. Kennedy of New York City, are planning to buy seven claims on Mt. Carmel, near Buena Vista, and to develop them by a tunnel. They propose to put on a plant of machinery at the mouth of the tunnel.

EAGLE COUNTY.

Johnson & Duffburg have leased the Warrior's Mark at Red Cliff and are doing the preliminary work of reopening the mine. They estimate that 50 feet of a drift will reach the ore shoot.—Hokenson & Turner, of Leadville, are reopening the Water Nymph.—The Mathias interest in the Last Chance lease has been bought by W. Greiner, and the lessees, starting work at 25 feet from the surface, struck an ore shoot giving good assays.

GILPIN COUNTY.

Some Central City school boys are picking over dumps during vacation and making very fair pay. One young fellow has received \$108 for three weeks' work, after paying 30% royalty, thus averaging \$6 per day.—The Raven mine in Russell district, near Central City, has been bonded to Denver people at \$40,000.

LAKE COUNTY.

Mitchell Bros., locators of the Mahala mine, have sold twelve-thirteenths of it for \$95,000. The thirteenth interest, stock held at Boston, and the Mahala M. Co. remains intact.

A company of Leadville and Toledo, O., people, has incorporated as the La Belle M. & M. Co., to operate the Black Prince mine of Leadville. J. W. Cummings of Leadville is a director of the company. Though little development has been done on the property it has, during the past five years, produced about 7000 tons of ore that have netted \$11.15 per ton from the smelters.

OURAY COUNTY.

The Camp Bird Ex. Co. at Ouray have started work on the Monument claim and propose to erect a mill during the summer on it. The company will soon start the driving of a tunnel to the Imogene basin to open up the several veins on the mine.

PARK COUNTY.

The Excelsior mine has been sold for several hundred thousand dollars. It has been opened for over twenty years and is equipped with a mill and tramway, but has not been operated for about seven years, the ore being refractory. Recent experiments have shown that by treating the ore chemically the values can be extracted at a handsome profit. It is said that the purchasers, who comprise a Denver and St. Louis syndicate, will at once put in a cyanide plant for the treatment of the ore.

The construction of a matte smelter for ores from the Alma district is projected. Tests of the ores have demonstrated that they are not suitable for concentration, and that either a cyanide mill plant or a matte smelter, the latter possessing an advantage in extraction over the former, is necessary. The proposition also includes an elevated electric tramway from the head of Montgomery creek to Alma junction.

SAGUACHE COUNTY.

B. J. Hillman of Victor reports a mining excitement at Indian creek, about 4 miles from Bonanza, based on float that runs twelve ounces gold and ninety-seven ounces in silver to the ton.

TELLER COUNTY.

Dalzell & Wilson of Cripple Creek, operating the lease on Vindicator shaft No. 11, are working ore in the 350-foot level, the shoot varying up to 3½ feet in width and carrying from an ounce and a half to two ounces of gold to the ton.

Dr. Cone, who exploited the Doctor mine, is installing an electric hoist on the Ophir claim at Victor and will operate the property, which has been closed down.

A 100-ton shipment of ore, averaging \$35 per ton, has been shipped from the Hoosier property of the Grafton Company. The bulk of the ore is from the 200-foot level, and some good mineral is being taken from the 400-foot depth of the workings.

IDAHO.

BLAINE COUNTY.

The agreement between the London, England, owners of the Minnie Moore group to sell to E. A. King of Chicago, Ill., and R. T. Austin of Kansas City, Mo., the Minnie Moore mine and improvements for \$30,500, of which \$2000 is paid, and the balance is to be paid in three payments with interest, closing in eighteen months, has been recorded.

BOISE COUNTY.

E. F. Blaine, Supt. of the Twin Sisters mine, near Idaho City, and R. Nye have sold the Oakes-Smith placer mine, near Centerville, to Illinois parties, reserving this year's run. Four water rights go with it, together with 45 miles of ditches. A new quartz discovery has been made

near Summit Flat, some 25 miles from Idaho City, by M. Graham. The ledge is 6 feet wide and the quartz shows free gold. The construction of a 5-stamp mill is projected.

CUSTER COUNTY.

L. Price of Hailey and eight men are on the Valley Creek mine, near Challis, and have begun its active operation. The ledge is 90 feet wide where it has been uncovered. The rock carries a little lead and a trace of copper, but gold values predominate.

KOOTENAI COUNTY.

The Funston M. Co. has been incorporated by P. Bach of Douglas county, J. R. McBride of Spokane and H. Belaine, F. H. Stokes and S. W. Smith of Kootenai county, capital \$5000, to operate the Hidden Treasure and the Copper King claims, in the Priest river district.

The Weber mine, on Lake Pend d'Oreille, is being reopened by F. Weber, S. Donnelly and A. B. Campbell of Spokane, Wash.

SHOSHONE COUNTY.

A. L. Halteman of Spokane, Wash., manager of the Eureka-Pacific placer mines, expects to turn on the water and hydraulic this summer.

A. M. Holter of Helena has bonded a controlling interest in the Alice group, near Wallace, and will sink a shaft on the ore body, which is 2 feet in width, assaying 70% lead and sixty ounces silver per ton. Mr. Holter will form a company to work the claims.

MICHIGAN.

HOUGHTON COUNTY.

At the Adventure the walls of the lower part of the mill have been laid and the floor piers are now in place. Excavations for the pump and boiler house are completed.—The Trimountain mill site is prepared for the foundation.—At the Champion mill site the excavation is under way.—At the Baltic the mill building has been completed and the foundations for the two heads of stamps put in. The mill will be ready to go into commission Sept. 1.

MONTANA.

BEAVERHEAD COUNTY.

W. A. Heimbuecker, assistant superintendent of the Montana C. & G. Co., which is developing the Manser group, near Dillon, reports that the new machinery is all in successful operation. At present the old shaft on the Ballarat claim is being enlarged to a double-compartment one. It is the intention to sink to a depth of at least 600 feet.

BROADWATER COUNTY.

W. J. Merritt, manager of the American Ex. Co., is operating the Kent group on Eagle creek. He is driving a 500-foot tunnel to tap the lead 187 feet below the present workings. The same company have bonded the Woods group, and are deepening an incline shaft to develop it. The company are also working on the Looking Glass claim, near Hassel.

The old placer mines of St. Louis gulch are being reopened to work the bed rock. The soil and gravel is 40 feet thick above bed rock. The operator, J. E. Wilson of Helena, believes that if the water supply holds out he will clean up \$500,000 worth of gold dust during the present season.

FLATHEAD COUNTY.

S. Sanford, manager for the Blackwell Co., and Contractor Cowell have begun the new improvements for that company at West Fisher.

GALLATIN COUNTY.

It is reported from Three Forks that the Ruby Dredge Co. has started working in the Missouri river below Three Forks. The dredge being used has a capacity of about 12,000 yards of gravel daily and is provided with appliances which save the fine gold.

Dr. McCoy and Mr. Klein of Belgrade have struck a lead of corundum in the Harris Kirk mine, in West Gallatin district, which they are working under bond. It is stated that a mill and other plant will be built.

JEFFERSON COUNTY.

L. S. Wild of Helena has leased the Cape Nome placer, located near Bernice. He will work a large vein of decomposed quartz in the ground. The ore is very soft and is claimed to average about \$10 in gold per ton. He will reduce the ore in an arrastra on the claim.

MADISON COUNTY.

The Newell Leasing Co. of Colorado Springs has bought the Oom Paul group in the Red Bluff district, and is starting development on an extensive scale. The claims are prospected by surface openings and show a vein of gold-bearing ore.

MISSOULA COUNTY.

T. S. Letterman has bought from D. A. Stewart his interest in the Barrette placer mining ground near Martina. A gold

dredger similar to the one now operated by the Western Montana M. P. Co. will be put on the claims.

SILVER BOW COUNTY.

The Speculator M. Co. has been incorporated by J. A. Creighton, J. M. Dougherty of Omaha, Mrs. L. F. Largey, B. Noon and W. W. Wilson, with a capital of \$150,000, to operate the Speculator mine at Butte.

N. A. Hall of Starvation Flats, on Dog creek, has found an artificial placer deposit upon his claim, consisting of tailings from the Penobscot mine deposited among the grass and willows. There are 10,000 tons of the tailings on the placer ground, which by cyaniding can be worked at a net profit of over \$1 per ton.

The total net earnings for the year of the Butte mining companies reported were \$15,949,735, an increase over the previous year of \$1,893,455. The complete figures are:

Anaconda C. M. Co.	\$5,571,815
Boston & Montana	7,042,300
Butte & Boston	586,055
Lexington	6,500
Speculator	175,000
Colorado	303,620
W. A. Clark (royalties)	2,510
Colusa-Parrot Co.	245,400
Snohomish & Tramway mines	53,300
E. D. Lassen (Neva mine)	2,600
Montana O. P. Co.	1,250,000
J. A. Murray (royalties)	340
Parrot Co.	510,195
W. W. Wilson (Oneida mine)	100

Operations on the Ophir mine at Butte have been suspended. It is owned by G. E. Blackburn of Butte, but was operated by a Kansas City company. A. Clark was superintending the work.

TETON COUNTY.

Work has been begun on the property of the Michigan & Montana C. M. & S. Co., recently consolidated with the A. M. Esler M. Co., near Altyn. Men are stopping ore preparatory to starting up the 10-stamp mill and concentrator.

NEVADA.

ESMERALDA COUNTY.

The Vulcan Con. C. Co., incorporated in West Virginia, will develop the mines at Siegelton, near Sodaville. Extensive improvements are projected. It is the intention to erect a smelter at the mines and put in a pumping plant to force water a distance of 6 miles to it.

NYE COUNTY.

J. F. Anderson, of the people who have bought the Tonpah mines, says that they propose to construct a railroad from Soda Station to the mines at Butler. The smelter returns from 432 tons of ore shipped are \$92,112.09. It is estimated that there are 2500 tons of \$60 ore on the dumps, making a total of \$240,000 thus far mined.

WASHOE COUNTY.

The Empire C. Co. of S. D. has bought the Crown Prince, J. & K. and nineteen other claims at Pyramid. The president of this company is C. S. Palmer; J. H. Robley of New York is secretary and treasurer, R. W. Parry of Reno is Supt. of the mine. Men have been put to work cleaning out the J. & K. tunnel and laying track to the breast.

The Hurricane claim, 3 miles north of Reno, owned by R. Mitchell, W. Prince and J. Cusick, is working five men and is down about 50 feet. On the surface the formation carried an ounce or two in silver and a trace of gold. It is now yielding from \$6 to \$8. The owners expect to sink a few feet farther and then drift.

At the Bell mine at Wedekind C. B. Bell is manager and Supt., E. Crane is foreman and J. M. Libbey is assayer. Three cars of ore are shipped weekly that average about \$1000 a car net. Returns on the last four cars were respectively \$1326.12, \$880.17, \$729.35 and \$1073.52. Preparations are being made to sink a double-compartment shaft to enter the ore body 600 feet down.

Darling & Gutling, receivers of the new smelter, have sold it to people represented by M. D. Young, who have bonded the copper mines at Pyramid Lake. The plant will be started up immediately. The amount paid for the plant was about \$4000.

NEW MEXICO.

LINCOLN COUNTY.

The New Mexico M. & M. Co. is working its Turkey creek property in the Nogal mining district. It is reported that a mill, tramway and water pipe line will soon be constructed.

GRANT COUNTY.

P. T. McGrath for a Boston syndicate has bought a large acreage of copper bearing mining land on which he states \$200,000 is to be expended in development.

T. Parker, who owns several turquoise claims adjoining the Azure M. Co.'s property, near Silver City, is working eleven men. In the White Signal district, south

from Silver City, J. Jeffers has bonded a turquoise claim to Eastern parties who are arranging to commence development at once.

OREGON.

BAKER COUNTY.

(Special Correspondence).—The Bald Mountain mine and mill are situated about 3 miles southeast from the Mammoth, the two groups being under the same management, and belonging to New England people. The Bald Mountain veins have a strike from northeast to southwest, in a slate formation. They vary in width considerably, but are said to average 40 feet wide between the walls. The ore shoots, within the ledge, carry free gold in a quartz, talc and porphyry, with iron sulphides carrying gold. It is stated that 40% of the gold in this ore is susceptible to amalgamation. The sulphides carry 3½% iron, 80% silica, a small per cent each of copper, cinnabar and silver. The mine is opened through a main tunnel which goes in 640 feet on the vein, from which a crosscut runs 370 feet to a second ledge; also by a shaft that sinks 200 feet on the vein near the tunnel entrance. From the shaft three levels are run on the vein, each about 700 feet long. All this work proceeds southwesterly along the ore ledges, there being some stopping above each level.

The mill is situated 2300 feet east of the shaft house and at a point 780 feet lower. A three-rail gravity tram line, built on an incline, conveys the ore from the mine to the mill. The latter is equipped with crusher, twenty stamps with plates, twelve Johnson concentrators. The mill is run by water power, the source of water supply being a small lake 703 feet above the mill. A flume 3 miles long and 2000 feet of pipe line conveys the water to the water wheels at the mill, by which 1.71 H. P. is developed with each miner's inch of water. A 4-foot Pelton wheel takes water pressure from a ½-inch nozzle; there are also other water motors of smaller size which run different parts of the mill. Manager McCallum states that their power costs 15 cents per day. The plan is to put in a cyanide plant to leach the concentrates. It is further planned to drive a tunnel on a level with the crusher floor of the mill which will cut the first ledge 1400 feet from entrance and at vertical depth of 900 feet; the other parallel ledges are expected to be reached 600 to 900 feet farther in. This deep tunnel will cut the veins 500 to 700 feet below the water level and drain the property. An air compressor will soon be installed to do this work with air drills. The Bald Mountain group is near the head of McCulloch's fork, 7 miles southwest from Sumpter.

The Annu Lulu group, between the Mammoth and Bald Mountain, is being developed by Mr. Trimble and associates. They have done some work on the contract between slate and porphyry.

A. W. Anderson and G. L. Rutherford are developing the Tammany group, which sidelines with that of the North Pole. They have done 500 feet of work on the Deer Lodge ledge, which runs north and south.

A number of locations on the east side of Cracker creek are attracting some attention. Among them are the Minneapolis, May Belle and Little Cracker. The first named is said to have been sold for \$12,000 to Seattle parties.

In Cable Cove, which is a basin near the crest of the range that separates the John Day streams from the Powder river system, is much activity in the way of development and some production. The California, Baby McKee and others form the centers of activity. The Germania group of eight claims, belonging to Geo. M. Diehms, 3000 feet from the California, is being developed some. In this locality the country rock comprises granite and serpentine, the ores being a copper and iron sulphide, with copper and gold values.

On the opposite side of the range, west from Cable Cove, the Constellation group of ten claims is being developed by Reed, Barstorf and others, the present work showing fair values in gold, silver and copper in a sulphide ore. The Gypsy Queen is the name of another group 1500 feet from the Constellation.

Bourne, Or., June 18. WASCOTT.

JACKSON COUNTY.

R. L. Cooper, of Crescent City, Cal., one of the owners of the Blue Ledge Co.'s mine on Joe creek, says in regard to the mine that the tunnel is in about 168 feet, and they have 300 tons of ore on the dump.

JOSEPHINE COUNTY.

J. S. Howard has completed the survey of the proposed ditch of the Ray M., I. & P. Co., at Gold Hill. The ditch will take water from Rogue river, 3 miles above Gold Hill, and carry it to an elevation of 58 feet above that stream at Gold Hill. With this fall it is intended to raise some

of the water 75 feet higher to make it available for working placer ground. It is proposed to operate an electric plant and develop 4300 H. P. Dr. Ray will be superintendent.

The Old Channel M. Co., Gold Hill, has sold its property to J. R. Harvey and C. B. Beardsley, who have been operating it under a bond for about a year. The sale price is stated to be \$90,000.

Stewart & Banfield, of Grants Pass, have discovered and are opening up near Althouse a quartz vein of great richness. From a shaft 20 feet down on the ledge they have mortared out from \$25 to \$100 per day in coarse gold.

H. Leuthy, at Althouse, has sunk a shaft and has a 1-stamp mill grinding out from \$30 to \$100 daily. A recent cleanup was \$2300.

A new ledge, rich in free gold, has been discovered at Placer, and is being developed by Browning & Son, who operate a 3-stamp mill in Placer connected with the Yellow Horn mine.

The equipment for the Rising Star mine in the Applegate district, near Grants Pass, consisting of five stamps to be added to the battery of ten already in operation, air drills, pumps, concentrators, engines and additional boilers, is being installed.

WALLOWA COUNTY.

The Hibbs group of gold-copper claims on Innaha has been sold to a Fargo, N. D., company for, it is reported, \$15,000, \$2500 down. The sale was made by M. Hibbs and E. H. Parton of Joseph.

TEXAS.

STONEWALL COUNTY.

E. B. Evans, Dr. D. H. Tucker of St. Louis and L. Jobe of Clebourne, Texas, have secured copper lands in this county, ore from which has been assayed and runs high in copper.

UTAH.

BOX ELDER COUNTY.

The Susannah G. M. Co. has been incorporated, capital \$150,000; J. T. White is president, E. B. Critchlow secretary and J. B. Toronto treasurer, with office at Salt Lake City. The company owns the Susannah, the Susannah Annex and the Helen mining claims.

The Planet G. M. & M. Co. has been incorporated to develop the Alice and thirteen other claims in Park valley; capital, \$50,000. J. T. White is president and J. B. Toronto secretary and treasurer, with office at Salt Lake City.

JUAB COUNTY.

The titles to the Uncle Sam, on Godiva mountain, at Tintic, having been approved, \$250,000, the balance due, has been paid to J. Knight. From the abstract it appears that for the Uncle Sam proper Mr. Knight paid less than \$30,000. It has yielded him over \$800,000.

SAN JUAN COUNTY.

The International M. Co. has arranged for the development of its properties near Castleton, in the La Sal country. D. Ferguson will be manager.

Mine operators in the La Sal basin have united in a project for the construction of a smelter near Cisco. The stock will be subscribed by the mine owners and the company will issue bonds at par, accompanied by stock bonuses. S. A. McLean is in Chicago to secure the necessary money for the building of the plant. In connection with the smelter an electric road will be built from Miners' basin to the smelter.

SUMMIT COUNTY.

At a meeting of the Park City & Mid-night Sun M. Co., D. A. Gillis was elected president, superintendent and general manager, and W. P. Mortenson secretary and treasurer, with office at Park City. It was decided to run the lower tunnel in 100 feet more, with the expectation of cutting the first ledge within this distance.

It is reported that the Daly mine is to be reopened under J. Quinn, the former foreman. It is said that for the present it is to be worked through the Ontario.

TOOELE COUNTY.

It is stated that Senator Clark of Montana has decided to build a furnace to reduce the concentrates of his Ophir mine to a matte. At present they are hauled from the mines in Ophir canyon to Stockton, and then shipped by railroad to a custom smelter, so that the possible earnings are seriously reduced.

WASHINGTON.

OKANOGAN COUNTY.

(Special Correspondence).—The American Flag mine is in the Methow district, 40 miles northwest from Ives landing on the Columbia. The mine is opened up by about 2500 feet of tunnel and drift work. A stamp mill, with plates and concentrators, is being completed, which is expected to begin operating by August.

The Slate Creek district is reached by

the Methow road, and is on the west slope of the Cascade range. In that locality the Eureka, belonging to Chas. Lane, is operating a 10-stamp mill and ten additional stamps have been ordered. The Mammoth, which is operating a 5-stamp mill, has ordered equipment for twenty more stamps. The ores of the Methow and Slate creek districts are free-milling gold quartz, to a large extent, with perhaps the necessity for cyanide work on the plate tailings.

Loomis, July 5.

FERRY COUNTY.

The ore body has been reached in the lower tunnel of the Malachite. A contract has been let to haul ore to Wilbur. The Lorraine C. M. Co., composed of Grays Harbor people, are the owners. F. J. Chamberlain is manager.

The Republic mine was closed down on the 29th ult. The mill is closed. No announcement is made as to the cause.

SPOKANE COUNTY.

The Metador M. & M. Co., capital \$5000, has been incorporated by W. F. Boettcher, G. S. Armstrong, J. W. Gilson and W. H. Bell of Spokane, M. Jacobs, Kendrick, Idaho, and J. A. Ghent, Wallace, Idaho.

STEVENS COUNTY.

A ledge of copper-gold ore has been found on the farm of M. C. Peltier at Fruitland by A. King, who has a shaft down 52 feet and a tunnel in 145 feet. Assays show from \$3 to \$30 in gold and \$4 to \$35 in copper.

WYOMING.

FREMONT COUNTY.

Ore taken from the copper strike recently made in the Lost Cabin mountains, 20 miles south of Thermopolis, shows over 50% copper, and development work is to be begun immediately by M. C. McGrath, who will have a 150-foot shaft sunk.

FOREIGN.

BOLIVIA.

J. M. Burnell, formerly of Denver, recently returned from Bolivia, says of the Gold Exploration Co. of Colorado and Bolivia, of which he is manager, that the company owns placer claims on the Tipuani river, in Bolivia, in which locality there are several other mining companies. In the same district is the property of the Bolivia G. M. Co., managed by C. Lincoln, formerly of Denver. His company's holdings on the Tipuani, he states, are about 1000 miles from the coast, reached by rough mountain trails, over which it is almost impossible to transport machinery. The country is very rich and the mining laws favorable. Americans and Europeans are beginning to come in. The Europeans are merchants and the Americans are miners. Mr. Burnell will return to Bolivia to push the development of the company's property, installing a hydraulic elevator on his return.

BRITISH COLUMBIA.

The Granite mill, at Nelson, which has been running for some time past on the Poorman ore, has been shut down.

At the annual meeting of the North Star M. Co., at Montreal, it was decided, owing to the low price for lead and excessive charges for smelting and transportation, to curtail shipments from the mine at Nelson. F. Robbins, manager, stated that the shipments had already been curtailed from nearly 2000 tons a month to 1000 tons, which the company is under contract to ship monthly to the Trail, Nelson and Everett smelters.

Ehrenseller & Beer, representing the Antwerp Smelting & Refining Co. of Antwerp, Belgium, have been in Kaslo to make arrangements to handle the silver-lead ores of Slocan.

The Kaslo Smelter Co., Ltd., is having E. D. Wilson of the Standard Smelting Co. of Montreal investigate the smelting situation at Kaslo.

Gold to the amount of \$3200 is the product of three weeks' washing at the Wreck Bay beach sand mines on the west coast of Vancouver island.

The London and the Richelieu mines will soon be ready to ship sixty tons of ore daily over the new tramway. T. G. Roy, manager, says it is the intention to erect a mill this summer.

Work is to be resumed on the Leviathan group on the Kootenay lake.

At the Hayes property, at Alberni, Vancouver island, wharves, air compressors, reduction works and an aerial tramway are to be built, and, it is understood, in a very short time a smelter on Alberni canal.—J. T. Hunter of San Francisco has bought the Thistle group of claims at Alberni for \$15,000. Development will be made at once and machinery will be shipped in immediately.—On the Golden Eagle a road is being built from Mineral Hill to the mine and 100 tons of machinery taken in. It is understood that a concentrator and an aerial tramway will

be built, the terminus of the latter on the canal to be at China creek. Mr. Newton, the owner, has also called for bids for a wharf at China creek.

W. Callander of Canmore says he has made a find of a mica ledge 30 feet in thickness. He intends to bring several cargoes to Beaver by boat this summer.

W. Alpersen, M. E., president of the Richmond M. Co., has bonded of Ellis Bros. & Critchley for \$50,000 the Morning Glory group, a copper property on Copper creek, the Monarch group, with galena and gray copper showing, on the north fork of Toby creek, and the Silver Pass, a galena and copper group adjoining the Red Line and the Iron Cap, which are being operated by the Fraser & Chalmers Co. of Chicago. Preparations are being made for development work.

Work will be resumed on the Wilcox mine, near Ymir, owned by the Broken Hill M. & D. Co.

The B. C. G. Co. of London is developing a group of eighteen claims in Nicola district. The ore is rich in copper.

G. B. McAulay, managing director of the Cariboo mine, has arranged for forty additional stamps for the mill. It is understood that Mr. McAulay will lay out plans for sinking a new four-compartment shaft and will let a contract for a new hoist with a sinking capacity of 1500 feet.

The Mountain Iron property at Kaslo is to be opened by H. C. Reihle for a London syndicate. He has had extensive experience with the same ore in Belgium.

The Payne ore is going to the Noble Five mill for a 1000 ton concentrating test on the ore from the dump.

The Emily Edith group at Silverton is being worked by an English syndicate. The mine at the present time is developed sufficiently to warrant the erection of a concentrator, but the low price of lead is compelling the company to seriously consider closing down until the market is more favorable. Charles E. Hope of Vancouver is manager.

W. H. Hocking and W. Hocking have arranged in Ashcroft for work on the Maggie mine, 18 miles north of Ashcroft. Smith & Bryson of Ashcroft are also interested. Assays of 18% copper have been obtained from some parts of the ledge.

W. H. Brandon of Toronto is to work the Canadian group at Kaslo.

MEXICO.

The Paramide M. Co., of Riverside and Los Angeles, Cal., people, owning a concession of placer mining ground in Lower California, has voted to accept the offer of an outside party to put the necessary machinery on the mine to work it, he to get a share of the mine. The officers elected were: D. G. Mitchell of Riverside, president, and F. Kingman of Riverside, secretary. The company did considerable work on its mine a couple of years ago, but was not very successful. The party who now proposes to put in a plant to do the work will expend \$35,000.

Commercial Paragraphs.

THE Electric Railway and Manufacturers' Supply Co., of San Francisco, has moved its office and warerooms to the large brick building, Nos. 68 and 72 First street, near the corner of Mission.

H. M. SWETLAND has shipped to Arizona a machine for handling placer gravel. It has a capacity of 1000 cubic yards a day, and requires a water supply of only 300 gallons per minute. It was designed by and built under the supervision of Frederick T. Snyder & Co., mining plant construction engineers, Chicago.

BAKER & Co., metallurgists in platinum of Newark, N. J., are presenting to their customers a useful advertising novelty in the form of a dating stamp. The memorandum book, containing notes on the use and care of platinum ware, and an assortment of useful tables, was highly appreciated by their friends, and they believe that the dating stamp will meet with an equally cordial reception.

THE Denver office of the Allis-Chalmers Company have closed the contract with the Telluride Reduction Company to furnish all the machinery for the new bromine plant to be erected in Colorado to handle Cripple Creek ores. This will be an independent mill of large capacity, with ample capital. Mr. C. D. Grove, the chief engineer and metallurgist, is now at the Allis works in Milwaukee, where the plans are being prepared.

THE Calumet & Hecla Mining Co. have ordered from the Mine & Smelter Supply Company, of Denver, Colo., ten latest improved Wilfley concentrating tables for each of their six steam stamps in their new mills, a total of sixty tables. The Wilfley table was adopted after tests extending over several months in which many modern concentrating tables were thoroughly tested. The makers of the Wilfley table claim that the Wilfley table is the best table now in the market.

Personal.

CHARLES BUTTERS of Salt Lake City, Utah, is in London.

RICHARD A. PARKER of Boston, Mass., is in Salt Lake City, Utah.

F. P. DUNN has resigned as manager Balliet properties, at Baker City, Or.

E. J. TREBRISE has been appointed manager Madisonian mine, Sheridan, Mont.

F. A. GOURLEY of Nevada county, Cal., has recently returned there from Siberia.

ARTHUR WILLSON has been appointed manager De Beers Con. M. Co., Rhodesia, S. A.

F. O. WILKINSON of Sandy, Lincoln county, Nev., is sojourning in Los Angeles, Cal.

G. E. WARD, M. E., of Seattle, Wash., is examining mines near Wickenburg, Ariz.

J. MCK. ANDERSON, manager Gold Hill Ex. Co. of Toronto, Canada, is in the Lardreau, B. C.

E. P. MITCHENER of Stockton, Utah, has returned to that place from a trip to New York.

C. P. COLLIER, Supt. Octave G. M. Co. in Yavapai county, Ariz., has returned from Peru.

PROF. J. S. DILLER of the U. S. Geological Survey, is at Crater Lake, in southern Oregon.

S. A. GILCHRIST has been appointed Supt. Clio mine, Jacksonville, Tuolumne county, Cal.

MR. CARROLL of the Risdon Iron Works has returned to San Francisco after an absence of about two years.

C. W. AYERS, Supt. Grand View gravel mine, at Montezuma, Tuolumne county, Cal., is in Alaska.

A. T. JUDSON, M. E., of Los Angeles, Cal., is in Ketchikan district, southeastern Alaska, examining mines.

J. L. GLUYAS is in charge of the underground work at the California mine, Gaston, Nevada county, Cal.

R. S. ENSLOW, Pres. Jamestown, Cal., M. & M. Co., will return from an Eastern sojourn about the 16th inst.

E. P. PORTER of the U. S. Geological Survey is in Republic, Wash., examining the geology and mines of that district.

IRA A. PEASE, Supt. Amco hydraulic mine, Oroville, Cal., has been appointed Supt. Old Glory mine, at the same place.

CHARLES CHAMBERLAIN of Spokane, Wash., is at Dolomi, Prince of Wales Island, Alaska, examining gold mines there.

J. M. BURNELL, manager Gold Ex. Co. of Colorado and Bolivia, has returned from the latter country to Denver, Colo., for a short visit.

THEO. F. VAN WAGENEN of Colorado has assumed the general management of the properties of the Nevada Copper Co., near Lovelock, Nev.

MR. E. I. PARSONS succeeds Percy H. Stuart as general manager California Wire Works. The establishment now occupies new and enlarged quarters, 17-19 Fremont St., San Francisco.

Recently Declared Mining Dividends.

	Payable.
Mary McKinney G. M. Co., Colorado, quarterly 3 cents per share and 3 cents extra, \$60,000.....	July 10
Parrot M. Co., Montana, quarterly \$1.50 per share.....	July 29
Adventure M. Co., Michigan, \$3 per share.....	July 15
Swansea M. Co., Utah, monthly 5 cents per share, \$5000.....	July 10
Silver King M. Co., Utah, monthly 6 1/2 cents per share, \$100,000.....	July 10
La Fortuna C. M. Co., Arizona, monthly 5 cents per share, \$12,500.....	July 9
Dalton & Lark M. Co., Utah, 10 1/2 cents per share, \$256,725.....	July 10

Rocco-Homestake G. M. Co., Colorado, monthly 1 1/2 cents per share, \$4500.....	July 10
Mammoth M. Co., Utah, monthly 5 cents per share, \$20,000.....	July 12

Books Received.

"A. B. C. of the Telephone," 12mo., pp. 332, by James E. Homans, A. M. A practical explanation, with diagrams and illustrations, of an important mechanical device in every-day use. It will be a valuable aid in installing and maintaining telephone plants which do not have the services of experts. Published by Theo. Andel & Co., 63 Fifth Ave., New York City; \$1 postpaid.

Latest Market Reports.

SAN FRANCISCO, July 11, 1901.

SILVER.—Per oz., Troy: London, 26 1/2d (standard ounce, 925 fine); New York, bar silver, 58 1/2c (1000 fine); San Francisco, 58 1/2c; Mexican dollars, nominal San Francisco, 46 1/2c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62 1/2; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: \$67 per ton.

LEAD.—New York, \$4.37 1/2; Salt Lake City, \$4.00; St. Louis, \$4.32 1/2; San Francisco \$4.90, carload lots, 5 1/2c 1000 to 4000 lbs.; pipe 6, sheet 6 1/2, bar 5 1/2c; pig, \$5.25. London, £12 5s per ton—2.64 cents per lb. SPelter.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton —3.58 1/2 cts. per lb; San Francisco, ton lots, 5 1/2c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, \$15.25; gray forge, \$14.25; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$25; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 30c; 1000 lbs., 30 1/2c; 500 lbs., 30 1/2c; less, 31c; bar tin, \$3, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 flask of 76 1/2 lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 3/4 lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5 1/2c; slab, 5 1/2c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15 1/2c.

PHOSPHORUS.—F. o. b. New York 50@60c 3/4 lb.

ASSAY LITHARGE.—San Francisco, 10c 3/4 lb. small lots.

BISMUTH.—New York, \$3 lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 lb lots.

PLATINUM.—San Francisco, crude, \$22 3/4 oz.; New York, \$22 per Troy oz.

FERRO-MANGANESE.—Pittsburg, 80% domestic, \$58.50, large lots.

TUNGSTEN.—New York, \$3 lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c 3/4 lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 1/2c; less than one ton, 17 1/2c. No. 1*, 60%, carload lots, 13 1/2c; less than one ton, 15 1/2c. No. 1** 50%, carload lots, 11 1/2c; less than one ton, 13 1/2c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9 1/2c; less than one ton, 11 1/2c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10 1/2c 3/4 set; 14 oz., 40s., 9 1/2c.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14 1/2c; do., cs., 20 1/2c; 86° Gasoline, bulk, 20c; do., cs., 26c; 65° Naphtha or Benzine, deodorized, in bulk, per gal., 13 1/2c; do., in cs., 19 1/2c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's' bbls., 60c; cs., 65c; No. 1 bbl., 50@52 1/2c; cs., 55@57 1/2c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32 1/2@33 1/2c 3/4 lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c 3/4 lb.; soda ash, \$1.90 3/4 lb.; hyposulphite of soda, 2 1/2@3c 3/4 lb.; blue vitriol, 5 1/2@6 1/2c 3/4 lb.; borax, concentrated, 7@8c 3/4 lb.; chloride of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2 1/2@2 1/2c; California refined, 1 1/2@2c; nitric acid, in carboys, 8c 3/4 lb.; caustic soda, in drums, 3@4c 3/4 lb.; Cal. s. soda, bbls., \$1.00; sks, 95c 3/4 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$3; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING JULY 2, 1901.

677,532—CAR FENDER—S. W. Alexander, Los Angeles, Cal.
677,533—PULLEY—D. B. Baker, Tacoma, Cal.
677,534—VINEYARD PLOW—J. A. Bilz, Pleasanton, Cal.
677,535—SAW GAUGE—C. F. Fowler, Columbia City, Ind.
677,536—EXCAVATOR—J. C. des Granges, S. F.
677,537—BOILER LEVELING DEVICE—Grisez & Walsh, Montague, Cal.
677,538—ROASTING FURNACE—B. Hall, Nevada, Cal.
677,539—WINDOW—E. Hipolito, Los Angeles, Cal.
677,540—RAILWAY—G. Larson, Hotell, Wash.
677,541—BRISTLE—H. O. Laussen, Newman, Cal.
677,542—STOP MECHANISM FOR MACHINES—F. T. Lottich, S. F.
677,543—PIPE BOILER—W. MacFarlane, Seattle, Wash.
677,544—WEIGHING MACHINE—J. Mader, S. F.
677,545—STAMP MILL FEEDER—A. C. Pratt, S. F.
677,546—MOSAIC PANELS—W. J. Blackwood, Monrovia, Cal.
677,547—ELECTRIC CUT OUT—F. H. Rogers, San Jacinto, Cal.
677,548—BICYCLE BRAKE—J. Schulte, Jr., Monterey, Cal.
677,549—TELEPHONE SWITCH—W. D. Watkins, San Jose
677,550—ANCHOR—J. N. Young, Alameda, Cal.
677,551—DESIGN—O. H. Greene, Red Bluff, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DISK HARROW.—No. 677,140. June 25, 1901. O. T. Owens, Altamont, Cal., one-half assigned to J. E. Allison. This invention comprises a series of turnable disks, disk-shaped cutters journaled to revolve approximately in front of the first-named disks, and to enter the ground so as to resist the side thrust of the latter disks, means for supporting the first-named disks and permitting them to be turned and held at an angle with relation to the cutters.

FARM TRUCK.—No. 676,972. June 25, 1901. J. A. Ashley, Yuba City, Cal. This invention relates to vehicles of the class used in gathering fruit in orchards and vineyards, or where movement or turning in a limited space is necessary, with small size, lightness, strength and rigidity, and ease of riding to prevent damage to the fruit in transportation over rough ground. The truck is formed with an arch at the front of the body, connecting it with the front axle, the forward end of the arch having an abutment directly over and upon the axle where the rear end of the body is

supported upon springs secured to the rear axle. Stirrups are employed, which the axle has a free, vertical, sliding movement, and means by which the stirrups are relieved from strains caused by the draft of the apparatus.

PORTABLE FORCE.—No. 677,148. June 25, 1901. Wm. C. Thurman, Santer, Cal. This force includes a hearth having a transverse fire-pit extending completely across and open at the ends, a main air passage, passages branching from said main passage and having tuyeres entering the pit, and a controlling device substantially at the junction of the branch passages with the main air passage to regulate the blast in the branch passages.

VINEYARD PLOWS.—No. 677,495. July 2, 1901. J. A. Bilz, Pleasanton, Cal. The object of this invention is to provide gang plows, which are designed to work between regularly spaced rows of vines or trees, and it consists in a novel construction and arrangement of plow frames, standard and adjusting sockets, journal-boxes of the wheel axles and adjusting lever mechanism whereby the location of these parts may all be shifted or reversed in a single apparatus, and the plows may be first used to throw the earth away from the rows, and afterwards adjusted for a second plowing to throw the dirt towards the rows.

NOTICE.

THE JAMESTOWN MINING AND MILLING COMPANY has to announce to the public that they are now open for its inspection. Their property consists of three full mining claims in the very heart of the great gold district of Tuolumne County. Among their property is the well known "BADGER" mine, which is adjacent to the famous "ROYAL," for which an offer of \$1,500,000 was recently refused. The ore of the Badger mine is ribbon quartz having an average of \$15 in free gold and carrying about one and one-half per cent of sulphurets assaying from \$250 to \$300 per ton. With improved machinery, the cost of mining and milling will not exceed \$3.25 per ton. Now, in view of the fact that the JAMESTOWN M. & M. CO. realize that, in order to make their mines productive and paying properties, they must equip and prepare the mines for the extraction of ore, they will place 25,000 shares of their treasury stock, which is 100,000 shares, on the market at the very low price of 50 cents per share; which will place the mine on a first-class paying basis, in view of the developments already done on the mine. And they are confident that the last 50,000 shares will have a value of \$2.50 per share. To those contemplating an investment in a first-class prospecting and one that cannot afford to be overlooked, as it will bear the closest investigation. PROSPECTUS and the fullest information can be had at the Company's office, Room 21, No. 40 Montgomery St., San Francisco.

J. W. BYRD, Secretary.

MINERS' AND PROSPECTORS' GUIDE.

REVISED THIRD EDITION.

Published by JAMES IRVING & CO.,
128 N. Main St., Los Angeles, Cal.

Contains U. S. State and Territorial Mining Laws, as well as much useful information for miners and millmen.

Price 25 Cents.

SITUATIONS WANTED.

A first-class machinist, engineer and cyanide man wants situation. Ten years' experience in cyanide plant; three years foreman; three years superintendent. All references. Box 31, this office.

MINING ENGINEER.—Position wanted by a middle-aged man of family. Complete technical knowledge. Experience in surveying, draughting, assaying, and qualitative analysis. Own instruments. Nominal salary. References. C. J. O'Brien, 455 Eddy St., San Francisco, Cal.

WANTED.—Position as superintendent of mine or mill by a technical graduate, not in charge of a 21-stamp mill and cyanide plant. Am a good assayer and mine surveyor, also a U. S. Deputy Mineral Surveyor. Add care E. M., care Mining and Scientific Press.

Wanted, a position as superintendent of quartz mine. Have had years of experience. Can do anything about a mine or mill. Know the value of a dollar in labor or material, with common sense to back me. No objections to go to South Africa, Corea or Mexico. Can give references. Address B. X. 30, this office.

Superintendent of a large silver-lead mine for the last five years wishes to change position. Has worked in Montana, Idaho and Canada for 22 years as miner, foreman, superintendent and manager. Thoroughly competent assayer and surveyor and competent to handle men. Care B. C. A. Mining and Scientific Press.

A sober, industrious, young man, who is a competent surveyor, assayer, draughtsman and book-keeper de-lies a situation. Understands the preparation of maps thoroughly. Good references; salary reasonable until salaries are demonstrated; practically trained; three years' practical experience. "M." care of this office.

PRACTICAL SMELTERMAN,

who had experience with sulphide and carbonate copper and lead ores in California and Mexico, is competent to design or take charge of smelter, wants responsible position as chemist, furnace boss or superintendent. Address "Metallurgist," care Mining and Scientific Press.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

A. M. DONALDSON & CO.,
ASSAYERS AND WASTE PRODUCT SMELTERS,
1661 Larimer St., Denver, Colo.

Donaldson's Assayers' Slag Hammer \$11.00
\$11.80 & \$12.75

SPECIAL NOTICE.—Capitalists and wealthy syndicates desiring to purchase large operating gold and copper mines at owners' bedrock prices, can most likely find what they want by corresponding directly with the undersigned. By doing so, buyer and seller can be brought together without the intervention of useless and undesirable promoters, brokers and middlemen. We have several very desirable properties now for sale. B. J. FRASER, 622-623 Parrott Bldg., San Francisco, Cal.

"Better Looking Oil Than We Buy."

The Burt Mfg. Co., Akron, O.
We are very much pleased with the filter purchased from you some time ago. It gives us perfect satisfaction, and gives in return a better looking oil than we buy.

The White, Corbin & Co.,
Rockville, Conn.
Shall we send one on approval? You can return it at our expense if not satisfactory.

THE BURT MFG. CO.,
Akron, Ohio, U. S. A.
Largest Mfrs. of Oil Filters in the World.

We also make the BURT EXHAUST HEAD.

Quicksilver
BY THE FLASK OR CARLOAD.
The Eureka Company,
OF SAN FRANCISCO.
330 SANSOME STREET, SAN FRANCISCO.

Quicksilver
IN LOTS TO SUIT.
Send for Quotations.
REDINGTON & CO., 23-25-27 Second Street,
SAN FRANCISCO, CAL.

BRITISH COLUMBIA MINES.
Mines and prospects in British Columbia and the Northwestern States.
Free-milling Gold properties on very reasonable terms.
Excellent chance for profitable investment in legitimate mining.
Correspondence solicited.
Address ANDREW F. ROSENBERGER,
P. O. Box 700, Nelson, British Columbia.

FOR SALE OR FOR LEASE.
Placer mine, 1/2 of a mile of valuable river bottom on Calaveras river, Calaveras Co., Cal. Machinery complete. New four-room house, stables, etc. For further particulars, apply to P. KOPPEN, No. 333 Front St., San Francisco, Cal.

"THE DANIEL BEST" 50 Horse Power TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

# THE GRIFFIN THREE ROLLER ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

### The . . . . Wilfley . . . . Concentrating Table . . . .

The most satisfactory concentrating table now in use.  
It will give better net returns than any other machine.  
It will make a satisfactory saving on the finest slimes or will handle pulp as coarse as 8-mesh to equal advantage.  
The Wilfley Table is made only under the personal supervision of the inventor. It is built right and all possible improvements are embodied in the later machines.

Send for circulars describing the latest improved table.

## THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/4" wide by 1 1/4" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars Address : : S. K. SNODGRASS, Denver, Colo. (The Windsor)

### The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot, (14 inches high) Ballows Tongue. Made on any style too desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tannage) making the leather Water Proof. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two  
years' use am convinced it is the only machine  
that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine  
or coarse, with proper usage. We save Gold read-  
ily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Sam-  
ples (concentrates) received and are finest work I  
have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver  
Treatment, Ft. Wayne, Ind., says: "That little  
machine is a daisy. The fact that you readily  
save values that float on water is to me the most  
convincing argument against the wet system."

## The Hooper Pneumatic System

is the only reliable method of treating  
mixed, slimy or rebellious ores. Zinc  
and lead combinations handled in good  
shape where all other processes had  
failed.

SOLAR  
HOUSE  
LIGHTS

For houses not having gas or electric  
light service, and for those that have,  
but wish economy and independence.

Costs \$4.00 Per Light  
EACH LIGHT LASTS A  
LIFETIME

Give a steady light, brilliant as electricity,  
and whiter. Exels any town gas service in  
existence. No complications; nothing to get  
out of order. Simple as A, B, C. Handy as a  
"candle"—jets can be carried around anywhere  
in the house. Gas cannot escape, like from the  
town mains. No smell, no smoke and no dan-  
ger, as with kerosene or gasoline. No accident  
of any kind possible, and the whitest, steadiest  
and richest light that is known.  
Write us for particulars.

DISTRIBUTORS TO THE TRADE:  
BULLARD & BRECK.

131 Post Street, San Francisco, Cal.

## FRENIER'S SPIRAL PUMP.

For Elevating Tailings,  
Slimes, Battery Sands  
to Jigs, Etc.

NO VALVES.  
NO BUCKETS.

### Mining Locomotives

Injury to controlling and motive mechanism by external causes prevented by enclosing the motive apparatus within the body of the locomotive.

Especially adapted to low and narrow passageways.

**Westinghouse Electric & Manufacturing Co.**

All Principal Cities  
in U. S. and Canada.

Pittsburg, Pa.

## Twentieth Century Racine Launches.

**FOR BUSINESS  
OR PLEASURE.**

THESE boats are made by one of the oldest, largest and most successful boat-building concerns in the country, and we can demonstrate that we can give the best results for the least money. Fifteen to twenty-five foot launches and all size row boats carried in stock for immediate shipment. Any size gasoline launches up to fifty-foot. Launches as low as \$185.00. If complete boats are not desired, we can furnish machinery equipment. Electro vapor motors for launches combine absolute safety, economy and simplicity; in fact the maximum of power in the minimum of weight and space. An ideal motor designed and built upon scientific principles after actual experience; no experiment. No government restriction; no licensed engineer or pilot; no smokestack; no fire; no noise from exhaust; no naphtha under pressure; no heat; no disagreeable odor; no boiler, coal, wood or fireman required. The perfection of power for small launches. Every launch is run in the water over a measured course before shipment. Motors  $\frac{1}{4}$  to 6 horse power, single cylinder; 8 to 16 horse power, double cylinder; 18 to 24 horse power, triple cylinder. Send 10 cents in stamps for 80-page boat catalog.

### BAKER & HAMILTON,

And in accordance with law, and an order from the Board of Directors, made on the 26th day of March, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of said corporation, in Rooms 322-323 Parrott building, San Francisco, California, on MONDAY, the 27th day of May, 1901, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. C. ANTHONY, Secretary.  
Office—Rooms 322-323 Parrott building, 325 to 355 Market St., San Francisco, California.

## POSTPONEMENT.

By order of the Board of Directors, the day of sale of the above delinquent stock has been postponed to MONDAY, the 24th day of June, 1901, at the hour of 1 o'clock P. M., at the office of said corporation in Rooms 322-323 Parrott building, San Francisco, California.

J. C. ANTHONY, Secretary.  
Office—Rooms 322-323 Parrott building, 325 to 355 Market St., San Francisco, California.

## POSTPONEMENT.

By order of the Board of Directors, the day of sale of the above delinquent stock has been postponed to MONDAY, the 24th day of July, 1901, at the hour of 1 o'clock P. M., at the office of said corporation in Rooms 322-323 Parrott building, San Francisco, California.

J. C. ANTHONY, Secretary.  
Office—Rooms 322-323 Parrott building, 325 to 355 Market St., San Francisco, California.

## CRIPPLE CREEK SHORT LINE.

## THE MIDLAND TERMINAL RAILWAY COMPANY.

Sixty miles shorter than any other line operating between Denver and Colorado Springs and Cripple Creek.

Three Daily Trains Each Way Between These Points. Through Pullman Sleepers.

W. K. GILLET, President. L. R. FORD, Gen'l Freight & Pass Agt.

Full Water-Jacketed.  
All Steel and Iron.  
5 to 100 tons capacity.

Sectional Side View of a Round Furnace, with Flue Dust and Fume Condenser, and Automatic Water-Jacket Feed and Water-Saving Attachment.

A. MERLE, President.

Established 1865.

## ASSESSMENT NOTICES.

WILLIETTA MINING & MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of June, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 8, 206 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

FRANK E. CORDES, Secretary.  
Office—Room 8, 206 Sansome street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of June, 1901, an assessment (No. 2) of Ten (10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 223 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALEX. GRANGER, Secretary.  
Office—Room 223 Crocker Building, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of June, 1901, an assessment (No. 3) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801 Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 13th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.  
Office—Room 801 Claus Spreckels Building, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of June, 1901, an assessment (No. 2) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 801, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.  
Office—Room 801, Claus Spreckels Building, San Francisco, California.

Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.  
If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time. If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and holding it in the position shown, take your readings in less time than you can elapse any other instrument. Send for descriptive catalogue B9 to

## POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.  
Send us your inquiries.

SOLE AGENTS.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

### CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 600 tons having been handled in ten hours time."

Every Builder

We want every builder to know about P & B Ready Roofing.

Want him to know that it contains the very best materials put together in just the proper way to make the strongest possible roofing that can be used.

During sixteen years of continuous manufacturing, we have yet to find a single customer who will say that P & B Ready Roofing is faulty.

Acids, rain, heat, smoke, fumes, vapor, do not affect it in the least.

Time is its only enemy.

Send for booklet giving full information about the Roofing and how to lay it.

The Lunkenheimer Automatic Injector

For All Classes of Steam Boilers.

Well designed, compact, efficient, durable, low priced and reliable. In action it is easy to start, has large range of work, full capacity, is absolutely Automatic and the discharge can be graded within wide limits. All parts are well proportioned, strong and durable, and any worn-out piece can be easily and quickly replaced at slight expense. Starts low at 22 lbs., works high to 185 lbs. Feed water 70 degrees, lift 3 feet, works without adjustment of steam or water at pressures from 60 to 180 lbs. Automatically restarts if operation is temporarily interrupted. Tubes are easily removable for examination and repairs by the simple use of a common wrench. Devoid of small parts which are easily lost or unreliable in action. Fifty per cent more durable than any other machine of its class. Retains original efficiency under constant usage and slight wear on tubes will not impair its operation. Works well with hot feed water and on long lifts. Impartial tests solicited and satisfaction guaranteed. Specify the Lunkenheimer Automatic Injector and order from your dealer. Send for descriptive circular and catalog of engineering appliances of superior quality.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all.
Yours respectfully,
ROBERT WALKER, Superintendent.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt.
Very truly yours,
ROANOKE MINING COMPANY,
Per G. M. WILDE, Acting Superintendent.

ROANOKE MINING COMPANY,
MOKELENE HILL, March 4, 1897.

For any information regarding Frue Vanner or Belts, call on or address

Taxation of Mines.

Great Britain, to recover the cost of the war with the Transvaal, has announced an intention of assessing a royalty on the gold production of the Rand mines, and has indicated 10% of the value of the gross yield as the probable amount of the royalty. The Canadian Government has for three years collected 10% royalty on the gross placer gold production of the Yukon Territory comprehending the Klondike, and this year has reduced the amount and is collecting 5%. The Russian Cabinet exacts 20% royalty of the gross gold yield of its placers. The Korean Government, with different concessions, has made different royalty rates on the gross gold yield up to 20%. One concession made the royalty on all metals and coal 20%. The Netherlands Government exacts high royalties and other taxes on mine production in the Dutch East Indies. The Government of British Columbia has several grades of royalty on gross metal production and a large number of indirect fees and charges that are paid for the privilege of mine operation, regardless of whether the mine is producing metal or is not producing it.

In the United States, Nevada had a bullion tax which was the equivalent of a royalty on the gross value of the metal production. It has been repealed. Montana imposes a 3% tax on the net annual profits of mining, on the net value production instead of the gross. Most of the States and Territories attempt to tax mines on their property value uniform in its incidence with the taxation of other property. Practically it is only an attempt. In Colorado the attempt has been made to tax mines on the basis of an assessment value determined by the selling value of the stock. Very generally in other States the mines that are not producing are taxed on far higher relative assessments of valuation than the producing and profit-earning mines of the same district. The writer has in mind an instance where a mine, paying its owners \$200,000 net out of a gross production of \$260,000 in one year, was that year taxed \$160 on a valuation of \$10,000. A mine alongside of it that did not produce a dollar of value, and in fact never did, having a finer plant of machinery, was taxed \$240 on an assessment valuation of \$15,000. The facts were known at the time, yet there was no protest at what would reasonably seem an absurd inequality in comparative valuation for taxation.

Through all these royalties and taxes there seems

a general recognition that taxation of mines and mineral productions of mines was based on different principles from the principles applied in taxing other properties. Just what the differences are does not seem to be definitely recognized. There is no common starting point for the rules of taxation and clearly no general recognition of the real thing that pays the royalties and taxes. Montana alone of all the sovereignties imposing mining taxes seems to have recognized what it was paid taxes and to have based its taxing laws on it.

A mine is not a reproductive property. Its yield of metal or mineral is not production in the same sense that a yield of agricultural or pastoral products is production. In the last case the land that produces can produce again; with a mine the yield is some of the valuable or reproductive part of the land itself and diminishes the total to the extent that it is removed. In the case of agricultural land and other such properties the tax is paid by the reproduction of the land; with land that is mined the tax is paid by the delivery of part of the land itself.

Taxation of agricultural land does not therefore absorb the land itself, no matter how long the period of years cumulated. Taxation of mines can absorb the land itself within a finite period of years, and it may be within a very short period. Therefore it is that practically mine taxation should deal with mine production rather than with mines, mining lands or the tools and machines of mining. Royalties are therefore more equitable in principle than taxation of mines on assessment of the land of the mines on the current exchange value of such land. With royalties the business of making a mine and the expectation of getting it are not taxed. With taxation based on current exchange value of the land both the business of making a mine and expectations are taxed.

To illustrate the preceding: A 1000-acre tract of

Interior Lightner Chlorination Mill, Angels, Cal. (See page 25)

placer gold-bearing land is provided with appliances, using which it will require 100 years to work out the gold. That is to say, the gold from ten acres only is obtained each year. With the current exchange valuation for assessment by which each acre is assessed equally with another, gold which must remain in the ground ninety-nine years before it is removed and available for division between the miner and the tax gatherer, is assessed and taxed exactly the same as gold mined the current year, and this last gold must pay the tax for the other gold. With ordinary tax rates of 2% to 3% the last gold to be mined would have had paid for it in taxes in advance two to three times its amount, exclusive of interest. It might suggest itself that the current exchange value of such land is too high; but that is another story.

Royalty on gross production in distinction from royalty or tax on net production is an unbusiness-like principle of taxation in that it fails to take into account the commercial idea. The production of a mine is divisible into two parts. One of the parts is given by the miner as costs and expenses paid in order to reduce to his personal possession the other part. The taxation by gross royalty limits the extent of the mining industry by limiting the number of mines that are workable. Gross royalty taxation may entirely wipe out the part of the production available as profit. The royalty on gross production taxing the cost of production is really double taxation. It is taxed both as the property of the miner and as the property of the people he has given it to.

The entire production of a mine is personal property. In the mine the mineral that may become production is not real estate; its status is not definable as personality; it is attached to the land. When removed from the land it is personality, but is not all the property of the one who removes it. Some is given up in costs. The net is the realizable personality. It is all that so far as the owners of the mine are affected is property—it is all on which they should be taxed.

COPPER MINING and reduction in all the countries of the world are being reported on by the United States consuls, at the request of the State Department, and the information gathered is now being printed and distributed in advance sheets. The data given are up-to-date and valuable in suggestion to copper miners in the United States, though no effort is made to give technical details. Reading the papers, the impression is fixed that the metallurgical advantage of the United States is in the quantity and richness of its ores. The mining and metallurgical practice of foreign countries would appear to be keeping up with advances in the technology of the art. The men who mine and reduce the metal in foreign countries are taking every advantage of possible economies of production, exactly as are our own miners and metallurgists, and are proportioning their work to results, just as our own people are. Still it seems clear that supremacy in production is assured to the United States and that the problem of profit in the business is to be worked out here.

THE ruling of the U. S. Secretary of the Treasury, that gold dust and gold bullion from gold mines in foreign countries, brought into the United States for assay and sale, must be accompanied with a consular invoice and enter subject to customs regulations, the same as any other form of merchandise, is calculated to subject the American and other miners in the Yukon, who desire to have it assayed and converted into money through the Seattle, Wash., assay office, to the loss of an additional shave on the gold production of their mines. The basis of the decision is that gold dust and such mine bullion is not money or "medium of exchange" between bankers, therefore it is merchandise. The consular invoices and customs entry fees are charges that the gold must pay, for which there is not visible the slightest return of service. The establishment of a Canadian Government assay office at Vancouver, B. C., and the establishment of a mint at Ottawa, Ontario, do not get around the difficulty at all. The gold leaves Canadian territory at White Pass summit, on the land side of Skaguay, Alaska. To reach either place provided by the Canadian Government where the gold could lose its merchandise standing and become a medium of exchange it would have to go through Alaska in Canadian charge under bond, which involves more unproductive expense. A Canadian Government assay office at Dawson, as suggested by this journal, would clear the difficulty entirely, and the miners would be given an additional incentive to turn their gold into the assay office and to pay the royalty. The present effect of the ruling is to in-

crease the gold production of Alaska at the expense of the Canadian Yukon, by providing an additional profit to successful dishonesty in avoiding the payment of the royalty.

The International Mining Congress.

The International Mining Congress which assembles at Boise, Idaho, on the 23d inst., will soon have made its record of action and recommendation part of the constructive history of the mining industry. Concerning its probable results the great changes that have been made during the year just passing, through the application of the modern commercial idea to mining, are educational in their suggestion of changes and improvements that will promote the mining industry through the initiative of the Congress.

The dominant commercial ideas applied to the business of mining are economies effecting a reduction of the cost charges on mineral production and organization insuring a profit to the capital engaged in the business. In such action as the Congress may take and in such recommendation as it may make these same commercial ideas should be controlling. In the United States the business of mining should not have to recognize State or boundary lines other than national. Political and legal conditions should be the same in all the States, Territories and dependencies of the United States.

First of all in importance as contributing to the purposes for which the Congress meets, is the initiation of political action to secure the establishment of the National Department of Mining and a Secretary of Mining as first proposed many years since by this journal. With this department and an advisor of the President the business of mining in the United States would be in the position to secure the same national commercial gain that has come to agriculture through the establishment of a Department of Agriculture and a Secretary of Agriculture. Both an economy of cost in mineral production and an aid to organization to insure profit will come from the proposed political action becoming successful.

In recommendations relative to changes and additions to the existing mining laws there are many that the Congress can make specific. It may be suggested that the importance of some of those here considered warrant the initiation of political action to back up the recommendation to legislative action.

The Congress should be specific in recommending the abolishment of extralateral rights as an appurtenance of lode locations made after a fixed date. The square form of location for all locations is a detail that is suggested for inclusion in the declaration of the Congress. The change would be an economy in cost charges against mining by a large elimination of non-producing litigation expenses. The argument sustaining the change proposed has been set out in detail in this paper so frequently that its restatement here would be superfluous.

The Congress should be specific in its recommendation of such changes in the law of location of mining claims that discovery of valuable mineral made and declared should be the condition precedent to the making of a location. The precedent of Colorado miners and courts establishing this principle and basing on it a marvellously successful development of that State's mineral deposits, can well be considered the authority for the suggested recommendation of the Congress. The possibility of abuse under existing law through court constructions of the law, to which reference is made in detail elsewhere on this page, is the conclusive argument sustaining the necessity for the prompt action of the Congress in the matter.

The Congress should consider and declare such principles of taxation of mines and mining claims that they could be accepted as the basis of substantially identical taxation legislation in the several States and Territories. There is no uniformity in practice, and great inequality in taxation of mines in the several States and Territories. The reason for this condition, which should not exist, is principally lack of knowledge of logical principles from which to make the taxation. Montana seems to have practically applied the correct principle, and from it has evolved the plan of only taxing directly the net profits of the mines based on sworn declarations. The principle logically sustaining this plan is that the

value of a mine is solely in its realizable personality. The net product of a mine is personal property; it is the only property created by mining; and it does not exist as property until it is out of the earth and reduced to personality. The Montana plan of mine taxation is suggested to the Congress for investigation as the basis of declarations of principles of mine taxation.

The preceding all relate to the business of mining. They all relate to details of mining business which have numerical expression in dollars. It is business to consider them. It is business to intelligently and positively act as indicated by the conclusions of the consideration.

One matter—which is not business, but is a matter of sentiment connected with the mining industry—is commended to the consideration of the Congress for declaration of policy and recommendation. Col. N. E. Linsley of Spokane, Wash., in a communication to this journal some months since, very ably and convincingly advocated the establishment of a home for old prospectors. Since the communication appeared, published comments and private endorsements of the idea indicate that the beginning of the realization of the establishment is within the possibilities. Col. Linsley's word picture of his proposed home is of its maturity. The beginning can be on a more modest scale. It will be none the less a beginning because it is small. Like other things, it will grow. The Mining Congress, by its action, can make a Home for Old Prospectors which shall be an imperishable monument of its accomplishments.

A Bad Rule of Mining Location.

The establishment of a rule of mining location that a prior discovery of valuable mineral is not necessary to make a location will prove extremely mischievous in practical operation. It is the opportunity for fraud. In combination with other rules of the law it permits of an unlimited number of locations appropriating for any actual purpose vast areas of public land so long as the ostensible purpose is indicated as mining by compliance with forms of location. It would validate the abuses that have developed at Nome and other Alaska districts. It would validate such abuses as the appropriation of a strip of land 30 miles long and 3 to 5 miles wide made in Fresno and San Benito counties, Cal., by half a dozen people ostensibly for petroleum, though there is not a discovery of petroleum on the land. It would render possible the appropriation of the so-called public grazing lands in the Rocky mountain region. It makes possible a defeating of the national public policy in relation to the disposition of its public lands for the benefit of the people of the nation. The decision is probably the most vicious declaration of a court yet made affecting the law of location of mining claims. The opposite rule, that minerals of value must be discovered on the claim and declared in the location notice can work no private hardship and is a protection for the public and an advantage for it. What public policy and national industry require is that the valuable mineral shall preferably be out of its earth or rock storehouse and available as a commodity. Next to this preference it wants such valuable mineral proven in place commercially. The mining statutes of the United States were intended by Congress to promote this policy. The reward for private enterprise incident to the obtaining of the benefits of the public policy is purely subordinate to the benefit to the public. Consider the particular issue in the case on which the California trial court ruled recently where the validity of oil location was the issue. Is not the public more benefited by two wells or twenty wells bored on the same 160 acres for petroleum than by the boring of one well or no well at all? Is private enterprise rendered the less remunerative to the owner of the one well which first finds the petroleum by the rule that the discovery must be made before the location? Under the rule the owner of the well making the discovery would be able to include in his location and to appropriate the other nineteen wells or whatever number there were. The public who invest in the stocks of oil companies would have an incidental protection against fraud by the limitation of its field of activity. Except by criminal misrepresentation oil companies could not sell stock based on locations of oil lands unless discoveries of oil had been made.

Concentrates.

AN automobile has been successfully employed on mountain roads in California.

THE mineral from Gold Creek, Nev., said to be bedded with shale and limestone, is coal.

IT has been figured out that the average of the life or dividend period of mines is seven years.

A SPECIMEN received from Quartzite, Ariz., is chromite, commonly known as chrome iron.

THE production of the mines of Leadville, Colo., during the seventeen years since 1885 is \$177,020,926.

THE oil tank recently made for the Market Street Railway Co. of San Francisco is 90 feet in diameter and 30 feet high, and contains 1,280,000 gallons.

ABOUT the lowest head of water which is worth commercial utilization for power development is 6 feet. Turbine wheels are used with this very low head.

IN 1860 the steam consumption in the best engines was about 35 pounds per horse-power hour. It is now about one-third of this, less than 12 pounds per horse-power hour.

ELECTROMOTIVE FORCE (E. M. F.) is the name given to the energy given off by an electrical battery or generator which on the circuit appears as pressure and is the cause of all the electrical effects.

THERE are three zinc minerals mined commercially in the Missouri zinc district, the sulphide, sphalerite, the silicate, calamine, and carbonate, smithsonite. The first named is the commonest and most valuable.

PORTLAND cement can be manufactured from any rock materials having the proper ingredients in proper proportions, and variations in the method of manufacture admit of modifications in the proportions.

IT is estimated that under proper supervision of the cutting the forest reserves of the United States might be capable of supplying nearly a fifth of the annual consumption of lumber at the present existing rate.

THE Birmingham gauge (B. W. G.) is used in England for all kinds of wire and in the United States for iron wire. The American wire gauge or Brown & Sharpe (A. W. G. or B. & S.) is used in the United States for copper wire.

THE amount and condition of the carbon are the principal matters which regulate quality of a cast iron, and the usefulness of silicon and sulphur are important and chiefly useful from their effect in modifying and changing the influence of the carbon.

A PATENTED solder for aluminum contains among its ingredients an alloyed flux of phosphorus and tin. The flux removes the coating of oxide of aluminum instantaneously and the solder then takes hold of and joins the clean surfaces. In soldering the tool must be kept very hot and the metal parts to be joined should be heated.

AS the result of comparative tests of California and Texas fuel oils by the Southern Pacific Railroad the former was found to be about 2% the better in evaporative power. Theoretically the Texas oil should have proven the better owing to a lower proportion of oxidized oils.

AT the Rossland, B. C., mines the powder used in the stopes averages 1½ pounds 50% nitro-glycerine to the ton of ore broken. In advancing level or crosscut headings 10½ pounds to the foot is used. For the sinking of a shaft 9x20 feet the consumption of powder averages 25 pounds to the foot.

THERE is no general rule for fixing the percentage for depreciation of machinery used in mining or in fact of machinery used in any of the industries. With a mine producing, and with ore in reserve for the year's operation, a fixed sum equal to a fourth or fifth of the original cost in place would at the end of the mine operation prove not far from the actual fact.

IN France an improvement in the metallurgy of copper by the converter method is reported by which gold and silver during the converting are concentrated out of the mass of the copper into a copper alloy in the bottom of the converter, which is then parted by electrolytic treatment. The main mass of the copper is, however, produced so free of gold and silver that it does not require the electrolytic treatment.

IN the flow of water through a pipe the greater part of the head is employed in overcoming the resistance of the pipe to the flow. A smaller part, known as the entry head, balances the resistance to entry into the pipe of the water and the remaining portion gives the velocity to the water. Except in cases where the velocity is high the sum of the entry head and the velocity head will be less than 1 foot.

SULPHUR in coal can be present to a considerable percentage without danger of corrosion of firebox plates or tubes when used under a boiler. The fumes of dry sulphurous acid are not corrosive to iron plates at high temperatures. With water and a temperature less than 212° F. the corrosive acid is formed, but these conditions do not occur until the fumes and water gas of combustion are out of the firebox and boiler tubes.

THE locator of a mining claim has a right to the ownership of any abandoned improvements—such, for example, as a house—on the land within the stakes marking the boundary line of the location. Improvements that are not abandoned cannot be acquired by location

of a mining claim alone. They, however, become acquired by the mining claim locator when the location is patented. A miner does not lose the house he lives in by his forfeiture of the mining claim he built it on. He can lose it by the Government patenting the land to some other person.

TEXAS fuel oil differs considerably from California fuel oil. The former has a gravity about 22° Baume as compared with 14° to 16° Baume, flashing point 180° F. as compared with about 240° F., firing point 200° F. compared with 290° F., and its weight averages 7.43 pounds to the gallon as compared with 8 pounds to the gallon. The Texas oil contains the most sulphur and the California oil the more alkali and salty waters.

TOOL STEEL can be hardened without discoloring or oxidizing it by the use of common laundry soap. It can be applied to the article before heating it, but preferably just after heating it sufficiently to cause the soap to flow. The soap so applied covers the steel with a thin coating, which remains till the article is immersed in water, where it washes off or is removed by waste. The color of the steel is perfectly white and the surface absolutely clean.

SHEET IRON or steel No. 16 American gauge is $\frac{1}{8}$ -inch thick and weighs 2.5 pounds per square foot. No. 11 gauge is $\frac{1}{4}$ -inch thick and weighs 5.0 pounds per square foot. From No. 11 the decreasing gauge numbers are successively $\frac{1}{8}$ -inch more in thickness and .625 pound more in weight per square foot. Thus No. 5 gauge would be $\frac{3}{8}$ -inch thicker than No. 11, making it $\frac{1}{2}$ -inch thick, and would be .625 pound $\times 6 = 3.75$ pounds more in weight, making it 8.75 pounds per square foot.

THE laws of mining and other corporations in California have been changed by the new code going into effect July 1, 1901. It is no longer obligatory to adopt by-laws. A director elected to represent a minority cannot be removed without cause. The holders of a majority of the capital stock can call an election, though they number less than three. In all voting at meetings the books are conclusive evidence of the right to vote. Certificates of stock on which less than full payment has been made must show the amount that has been paid in. A method of replacing lost stock certificates by the issuance of duplicates is provided.

OLD PEWTER and britannia ware can be converted into commercial metal. The silver plating is first removed by putting the articles into nitric acid in a porcelain-lined pot. The articles are then thoroughly washed and dried. They are then broken up and melted, and, by changing the composition by the addition of tin, lead, antimony or copper, type, stereotype and babbit metal are obtained. When the acid taking up the silver is nearly neutralized, salt is added, which precipitates the silver as chloride. This is caught on a filter, fused in a black-lead crucible with flux, and thus reduced to metallic silver.

FOR massive concrete work it is often safe and practicable to use in the body of the structure large boulders and pieces of broken stone and thereby effect a considerable economy of cement where the economy is important. Where such material is used it should be solid and clean and should not contain iron oxides or sulphides, but be of similar character to the broken stone employed in the concrete mixture. As much as 30% of this coarse stone can be used. In the construction of the overflow dam and ditch headworks in the American river at Auburn, Cal., the large stream boulders and cobbles were so used. The fine gravel and sand just as it came from the river bed was used in mixing the concrete. The dam is over 300 feet long and has a midstream height of 40 feet.

THE quantity of water flowing in any channel is obtainable in cubic feet per second by multiplying the cross-sectional area of the waterway by the mean velocity of flow. The important point is the determination of this velocity. Floats are timed over a measured length of channel, several tests being made in different lines of parallel flow. The surface velocity for different sections is thus obtained. The velocity is much less at the bottom and sides of a channel and the average velocity is ordinarily between 80% and 90% of the maximum surface velocity. Generally 83% is taken as the coefficient. The quantity of flow then becomes equal to the cross-sectional area of the waterway multiplied by .83 of the surface velocity determined by floats. A second method of getting at the quantity of flow is by measuring the discharge through an orifice, either a tube or weir. The critical point of this method is the measuring of the head under which the flow is maintained.

THE law of mining claim location has been further complicated by the decision of a trial court in Kern county, Cal. The court held in a case over the right under location to a tract of land claimed for petroleum that the prior locator was entitled to it, though it was admitted that the junior locator had made the actual discovery on the land by boring a well. The rule here laid down has always been accepted between locators of drift placer mining ground under lava or cement deposits where discovery required long expensive prospect tunnels. The Land Department has taken precisely the opposite ground by refusing to patent such locations without an actual discovery on the claim, and in some rulings have required discovery on every ten acres, and have further required that proof should show a minable pay deposit. The decisions of the Colorado State courts and the U. S. courts in cases arising in Leadville made a rule requiring discovery of mineral in place a condition

precedent to location. It would appear that the decision of the United States Supreme Court is necessary to establish the law of discovery.

IN filing and setting saws attention should be paid to certain points. The teeth in crosscut saws should cut both ways. In every saw, crosscut and rip, the teeth should, as near as possible, be equal in length and equal in sharpness. The bevel on the tooth should be more acute for soft than for hard woods. In filing to get the same bevel, the file should be held at the same angle for all the teeth, and the same number of strokes with the same pressure should be given. Uneven teeth should be beveled with a flat file before starting to sharpen and bevel. Filing should be done from the handle toward the point. In no case should the saw be lower in the middle than at the ends. The feather from the sides of the teeth should be removed with a flat file or whetstone drawn smoothly over them with a very light pressure. The setting of the saw is important, as it controls the width of the kerf. The amount of the set depends on the character of the work and is a matter of personal judgment. Uniformity of the set must be secured. Either a hammer and punch is used in setting or a special tool of a lever type. The use of either requires practice and care.

THE United States Circuit Court has ruled in an Idaho case that mining claimants in a forest reservation can construct a water ditch in the reservation for their mining claims under the special conditions of the case in which it appears that the entire length of the ditch is on the mining claims. In the same decision the court ruled that as it appeared that the several mining claims were held in common, and that so long as it appeared they were located in good faith as mining ground, the claimants may use the timber from one claim upon another, but only for mining purposes. The right to export or sell the timber, or use it for any other purpose, is denied. The mining claimants are not permitted to cut any timber on the reserve outside of the claims except under authority of agents of the Secretary of the Interior. The ruling is only temporary pending the hearing of the case, but is fairly indicative of what the final decision will be. It seems to suggest that the courts will rule against the construction of ditches in forest reserve lands on the ground that there is no express authority of law directly permitting such construction, and no procedure provided in the Acts creating the forest reserves by which private parties can acquire the right of construction. The United States is plaintiff in the action, which is for an injunction. The decision was on the application for a temporary restraining order.

WHERE a lode location of a mining claim is made and it subsequently appears that the lode, instead of crossing the end lines of the location, crosses the side line, the rule of law is that the side lines become the end lines, and the extralateral right extends under and beyond one of the end lines and the side lines become the lines of the vertical end planes. If the claim has become patented before the discovery of the true apex line of the lode is made, the title to the surface has become vested and carries with it all other lodes that may apex within it. If the discovery is made before patent issues, any veins that apex over 300 feet away would seem to be subject to location. The law limits the width of ground to 300 feet on the sides of the apex line of the lode. The law will not make valid a location that does not conform to the law, simply because it was not so made intentionally. At the same time the law cannot be construed to deprive the locator of what he really discovered and located. No right, valid under the original location, loses its priority by reason of relocation to correct a mistake. The best plan under the conditions stated—a lode crossing side instead of end lines—is to relocate the claim. Some trial courts have decided that it was the surface ground staked that was located, instead of the lode, but it is safe to follow the application of the general principles of law in making locations.

THE copper ores of Rio Tinto, consisting of pyrite and chalcopyrite containing 2½% of copper, are roasted in piles in the open air. The roasted ore is then placed in large filtering basins constructed of masonry. These basins, 30 meters (98 feet) by 10 meters (33 feet) and 59 inches deep, have a false bottom of slightly inclined planks, so perforated that the liquid which filters through the mass can disappear under the false bottom, and from there through drainage sluices into the precipitating basins. The filtering liquid employed is water, which dissolves the copper in the form of copper sulphate. The washed ore is mixed with fresh ore and piled in heaps 3 to 4 meters (9.8 to 13 feet) high, through which apertures are made for the circulation of air. Oxidizing is again effected, the mass becomes warm, the sulphides and oxides of the first roasting become changed into sulphates, and at the end of six or eight weeks the mass is subjected to a second washing and leaching. The residue is again exposed to the air and leached, and so on during a period of two years. At the end of that time the ores are exhausted and contain but slight traces of copper. At Rio Tinto and Tharsis 500,000 tons of ore are constantly in treatment. The liquor charged with sulphate of copper is drawn into a series of canals in masonry, 600 meters (656 yards) long, at the bottom of which are placed bars of pig iron and old rails, which precipitate the copper as cement. After leaving the canals, the liquor, which contains then only a small amount of copper per cubic meter, is returned by pumps to the leaching vats, where it again serves as a solvent.

Genesis of Ore Deposits.

PART III.

Written for the MINING AND SCIENTIFIC PRESS by
MATT W. ALDERSON.

HOW TO TELL THE PROBABLE LIMITS OF ORE BODIES IN A MINE.—We have noticed certain peculiarities of streams and have found the indelible marks of stream action accompanying ore deposits, and come now to an observation of the valley itself in which the ore deposit was made. There are certain peculiarities about valleys common to many. Thus, if we drive across a typical valley (Fig. 3) we start on what is

FIG. 3.

called the first bench, then go down a decline to the main valley; then we go down again, across the stream and rise on the other side. If we approach a quartz vein as we would the crossing of a stream, we find all the peculiarities of present valleys duplicated.

Fig. 4 represents a true fault. There has been a

FIG. 4.

break in the formation and the ore enclosed by it and a shifting of the relative position the two sections originally held. Fig. 5 shows what is sometimes

FIG. 5.

erroneously called a fault, in reality a lapping of a shoot of ore deposited at one period over the edge of one deposited earlier, the first channel having been covered with sedimentary wash and a new channel having been made to one side and on a slightly higher elevation. It represents an actual situation in the Queen ledge, Granite county, Mont. Black in both these figures represents ore.

Fig. 6 is a representation of so-called faults found

FIG. 6.

at the head and foot of the Sherman incline in what is familiarly known as the Sunrise mine in Granite county, Mont. It is typical of what are frequently called faults in mines, but which are really not faults. There has been no break in the formation, no disturbance of the ore body. What seems to give color to the idea that these are real faults, oftentimes, is the fact that the ore is not in place in a uniform ore body on the face of one of these so-called "breaks" or faults, as it is in other places in the mine.

The mountain in which the Sunrise mine is situated was lifted slightly from the eastern side, tipping the ore body so that it dips to the west at an angle of about 20°. The mine is opened by a number of adits, the lowest being No. 3 west of discovery, which skirts for most of its length—several hundred feet—a so-called fault. An attempt to find pay ore still lower, at No. 4 west, resulted in failure. The showing of ore in No. 3 west was then taken up and followed down from the head of Sherman incline to level at foot. (See Fig. 6.) Some pay ore was found at

the foot of the Sherman incline and considerable work has been done in this section of the mine in an endeavor to find a permanent body of pay ore, but without success. From the point marked river bed in the valley in the direction opposite from the Sherman incline pay ore was found for a distance of several hundred feet. The illustration is given to make plain the fact that the limit of pay ore in any mine is the outer limit of the original valley in which the ore-bearing stream flowed. Not every mine will afford as clear an illustration, perhaps, as the one given herewith, but the practical mine superintendent can make a survey of his mine, taking the level of the ore bodies as they were originally laid down, and nothing gives this more truly in many mines than the smooth surface of the hanging wall, and if there is no mark

of the bench land outward from the side of an ore shoot there will be gradual elevations, which will mark the outward limit of the stream deposits and the limit of probable pay.

But there is something confirmatory of the rule laid down above. We notice the stream bed of gravel and we notice, also, that there are occasional thin layers of gravel in spots on the level of the bench, and that, in some instances, back near where the bench land rises to a higher bench or foothill, there is more gravel than elsewhere and the depression is greater. There is in this proof of the stream's having flowed back near the next bench longer than anywhere else except in and near the regular channel, and oftentimes the highest level of the bench is near where it slopes down to the stream. In like manner the ore is often found to be thin on the top of a bench near the main ore shoot, and thicker and of better grade back farther on the bench, as shown in Fig. 6. Further, the ore bodies on the benches will be more irregular in shape and their values more uncertain.

The character of the gold in the ore also indicates the position in the mine from which it comes. The ore in the main ore shoots of the Sunrise mine had an average assay value of over \$14, about \$10 of which were saved by amalgamation. The ore from the Sherman incline would hardly average \$5 and the millman would do well to make a saving of 25% on the plates, though ore of the same grade from the main vein would readily yield 50% by amalgamation. Ore in the Brother Jonathan mine, in Madison county, averaged \$12 in the main ore shoot and about 50% of this could be saved on the plates. The ore on the first bench, adjoining, seldom assayed to exceed \$2 and showed no free gold on pan tests. Where the stream flowed it would be natural to look for the greater precipitation. On the bench lands there would be only rainfall and standing and occasionally flowing water. The particles of gold in the bench deposits are lacking in thickness and appreciable size because they were not favored with sufficient quantity of mineral-bearing solution. This is the ore which must be worked by a wet process, even though ore in other parts of the mine may be made to yield a high extraction by amalgamation alone. In some of the mines of Butte we go down from 100 to 800 feet across the first bench of an ancient stream,

good showing of talc with a vein. It is a favorable sign, indicating, as it does, that the stream flowed quietly at such a place, as is proven by the deposition of such fine particles as talc is composed of—a condition favorable, as pointed out heretofore, to good precipitation of the precious metal contents of the stream. A better showing of talc will generally be found on one or both walls of the vein where the stream flowed longest. A smaller quantity is generally found with the bench deposits, and when found there it will be less compact and tenacious. The same is true of the talc in what are called the barren zones of a vein. Observation teaches us that in the course of time streams which cross valleys comparatively level do not always flow in the same place. In quartz veins we have separate shoots, made where the stream flowed at different times. Between these shoots will be places having less quartz, and that quartz will necessarily be of less value than the quartz on either side.

There are occasional islands in almost every stream. One must not mistake one of these for the limit of the ore body in that direction. It may be taken as such temporarily, till development in other parts of the mine determines its character.

The limit of pay ore in a mine in any given direction is the border of the valley in which the stream flowed which made the deposit. This may be a few feet or a few miles. If in the uplift which placed the vein in its present position the vein was set on end, the limit at the bottom will be where one encounters a true fault, a break in the formation, beyond which it may or may not be possible to take up the lost vein. Where on the sides the vein makes faults similar to those shown in Fig. 6, the intelligent miner will do sufficient work to determine his situation, but will not go on spending thousands of dollars in the belief that beyond such faults he will come into other shoots of good ore.

The writer's observations have led him to the conclusion that ore deposits have been lifted from the side more frequently than they have been set on end. But each mine must be read for itself, in the light of the knowledge that the ore was made by a flowing stream, on the surface of the earth, and that its formation is governed by the same laws as control all deposits of sedimentary character.

Comparative Tests of Fuel Oil and Coal.

Howard Stillman, mechanical engineer, who has made comparative tests of fuel oils and coal for the Southern Pacific Railroad, with which he is connected, reports the following data of evaporative tests made in locomotive service. The engines with which tests were made were of same size and make employed in passenger service:

	Petroleum.	Coal.
Miles run.....	224	224
Mean number of cars in train..	3.71	3.71
Weight of cars in train, tons..	113.01	110.40
Actual running time, hours...	7.55	7.63
Average steam pres're gauge, lb	133	130
Temperature of feed water, degrees Fahrenheit.....	660	660
Gallons water evaporated.....	6,603	5,980
Pounds water evaporated.....	55,025	49,833
Gallons oil burned.....	755
Pounds fuel burned.....	6,040	8,043
Evaporation water per lb. fuel..	9.11	6.19
Evaporation from and at 412° F	19.96	7.41
Pounds fuel to evaporate one pound water from and at 212° F.....	.09124	.1349
Equivalent of fuels for equal evaporation, lb.....	1.00	1.48
Ditto, by measure.....	*168.9	**1
Gallons water evaporated per gallon of oil.....	8.75
Miles run per ton.....	74.14	55.72
Fuel burned per hour.....	*100	**537
Total ton mileage.....	25.314	24.730
Ton miles per pound fuel.....	4.191	3.074
Ton miles per gallon oil.....	33.53

* Gallons. ** Ton.

The above items are from record made with careful attention to weights and measures. Summerfield and Los Angeles petroleum and coal from Vancouver Island were the fuels compared. Proximate analyses of the Comax coal was:

	Per cent.
Moisture.....	1.90
Volatile combustible.....	27.08
Fixed carbon.....	55.38
Ash.....	12.50
Sulphur.....	3.14
Total.....	100.00

The fuel oil used ranged in gravity close to 16° Baume, with flash point about 240 F., and fire point 290° F. In practice it is taken at weight of eight pounds per gallon, though it varies somewhat in gravity. Fuel oils from the Kern, Los Angeles, Summerfield, McKittrick and other fields are represented by the figures given. They are dark brown or black, very heavy asphalt oils, very thick and viscid at temperatures below 60°, and can only be handled by use of steam-heating coils in tank or around pipes.

As to relative cost of either coal or oil fuel, the relative values are based on the figures from the above test for equal calorific effect from and at 212°; that is to say, 168.9 gallons oil equal one ton of coal.

The Formation of Bonanzas in the Upper Portions of Gold Veins.*

NUMBER III.

BY T. A. RICKARD.

THE DISTRIBUTION OF ORE-BONANZAS.—The shifting of the zone of oxidation is a principal factor in determining the distribution of rich ores. By the erosion of the superficial portions of the vein, in common with the enclosing rock, the further downward penetration of the oxidizing agencies is facilitated. The depression of the ground water level lowers the zone at which precipitation of gold, from descending surface waters, takes place, while, on the other hand, when a change in the hydrostatic level causes the ground water to rise, the zone of deposition moves up. In both cases the tendency is to give vertical extension to the rich mass of secondary gold ore, and thus to produce the occurrence which the miners term a "shoot."

Erosion is followed by another result, in itself of great importance to gold mining. The steady removal of the superficial part of the vein causes the lower portion, which has been enriched at or below the ground water level, to undergo a relative elevation by being brought nearer to the surface. In this way the bonanza zone, in process of time, may become the outcrop. This appears to me to explain the formation of the extraordinarily rich bunches of specimen quartz, such as made West Australia famous in 1894 and 1895, and started the mining stampedes of other days elsewhere. In many instances fortunes have been gathered almost at the grass roots from veins which, on systematic development, have proved unprofitable. The gold quartz veins of West Australia traversed rocks of great geological antiquity which have not, during late geological periods, undergone any notable disturbance. We do not know at what period the veins were formed; but, even though their formation dates no further back than the beginning of the Tertiary, they have since been continuously exposed to the same quiet forces of erosion which have leveled the region until it appears as an arid tableland strewn with the wreckage of geological time.

Whatever the alternations of slow depression and elevation which have affected this region, as part of a continental area, it is certain that erosion has been long at work with patient constancy. Throughout this period chemical agencies have been active in the zone of weathering, near the surface, removing the gold to the zone of precipitation, near the ground water. Whatever the slight changes which have marked the level of the ground water from time to time, erosion has continued uninterruptedly, and therefore it has steadily gained, with the result that the enriched portion of the vein has been brought nearer and nearer to the actual surface, until it finally appears as the outcrop which rewards the search of the prospector.

THE LOCALIZATION OF ORE SHOOTS.—To the miner the localization of these richer portions of the vein is of more immediate practical interest than the theory of their origin. A gold vein is not a homogeneous mass of auriferous quartz, of tabular form, penetrating the rocks like a sheet of paper, but rather as an irregular occurrence of ore, the composition and shape of which are very variable, because they are the result of chemical agencies and structural conditions of great complexity. While the traces of the agencies which precipitated the ore are obscure, because they have been largely obliterated by subsequent chemical action, the relation between the vein and its enclosing rock can often be traced by observation. In this direction the miner obtains great aid from the geologist. The transactions of this Institute and the publications of the U. S. Geological Survey contain numerous clear expositions of such structural relations. The monographs on the Leadville and Eureka mining districts may be especially instanced as affording striking examples of the direct application of geology to underground work.

AUSTRALIA.—One of the best examples of the localization of rich ore came under my notice in 1890 in the Bright mining district. Bright is geographically in the Australian Alps, and geologically in the Upper Silurian slates and sandstones. Though these rocks have undergone metamorphism, and exhibit a well-developed cleavage, yet their bedding has not been obliterated. The veins cross the bedding planes of the enclosing country both in strike and dip. When investigating the distribution of the ore in the mines of this district, I found that the ore shoots had a pitch corresponding with the line of intersection between vein and country. This was well illustrated at the Shouldn't Wonder mine, 7 miles from the town of Bright. The lode was a simple quartz vein from 15 to 24 inches wide, carrying a small percentage of pyrite. It had a strike of N. 28° W. of N. and a dip to the N. E. of about 75°, while the country dipped S. W. 79° and had a strike of N. 55° W. The plane of the vein cut across the beds of the country and the intersections thus produced were to be seen along the foot wall of the lode as lines, pitching 42° to

46° southward. While the foot wall was more regular than the hanging, and therefore exhibited this feature best, yet the hanging also carried lines corresponding with those on the opposite wall.

The boundaries of the ore shoots in the mine followed these lines; and the longitudinal section of the workings, as seen on the mine maps, proved also that these lines of intersection had an inclination which coincided with the trend of the ore bodies, as stopped out between the four successive upper levels of the property.

At the Myrtle mine, in the same district, there was the same correlation between the pitch of the ore bodies and the line of intersection of the wall of the lode with the bedding planes of the enclosing country. The stratification was distinct, the rocks consisting of altered, silicified slates of a gray to gray-blue tint. In the stopes above the 700-foot level the pay ore was separated from the normal valueless quartz of the lode by a small step, due to the irregular fracture of the vein in crossing two beds of unequal hardness. It marked the line of intersection between lode plane and country bedding, and also proved to be the boundary of the pay shoot. In the different portions of the mine the variation in the dip of the country produced variations in the angle of the lines of intersection, and also in the pitch of the ore shoots.

It is not often that the formation traversed by a vein has such a simple structure as was presented by these Silurian sedimentary rocks; but it is probable that in other districts also the pitch of the ore bodies may have been determined by structural conditions of a similar kind, which have been obscured, however, by metamorphism.

COLORADO.—Experience has shown that the intersection of fractures favors the occurrence of rich ore bodies. An interesting example was afforded by the Moon-Anchor mine, at Cripple Creek, in 1899. This is illustrated in Fig. 1. The ore in the mine occurs

in a lode channel marked by a band of fractured andesite breccia. At the 400-foot level a small dike (EF) of granite, 2 to 6 inches thick, intersects the lode channel at a place where a counter fracture (CD) also traverses it. A triangle is produced by these intersections, and the ore is proved to surround a block of ground which is also mineralized, but not sufficiently so to be regarded in its entirety as pay ore. At the crossing of the dike and cross-fractures a very rich body of telluride ore was encountered.

This reminds me of the Yankee Girl ore body, mentioned by Emmons. This body of ore was of phenomenal richness, many ten-ton lots being shipped which carried seven or eight ounces of gold and 3000 to 4000 ounces of silver per ton. The ore was also rendered remarkable by carrying the rare mineral stromeyerite, a sulphide of silver and copper. Mr. Emmons speaks of the bonanza turning into low-grade pyritic ore as depth was attained. I may add that this change was not gradual, but sudden, and coincident with certain structural relations. At the surface, the vein consisted of comparatively low-grade ore, which led to the finding of a nearly vertical "chimney," averaging only 25 to 30 feet in diameter, of extraordinarily rich ore, consisting of the copper sulphides, bornite and erubescite, with stromeyerite and barite. The gold in the ore was associated with the barite. From the second to the sixth level, at about 500 feet below the surface, this bonanza proved immensely productive; then, suddenly, a flat floor, dipping west and accompanied by clay, crossed the deposit. This flat vein was worked for 90 feet, from the south drift at the No. 6 level, and contained ore similar to that of the Yankee Girl chimney. The

latter was found again deeper down, and out of its former line of descent, but it was much diminished in richness, and appeared to merge into the general body of low-grade copper and iron pyrites which characterized the lode at the tenth level. This mine and its neighbors, the Robinson and Guston, are idle now. They are in the andesite breccia of the San Juan region. The Yankee Girl chimney was situated, I believe, at the crossing of three lode fractures, appearing as brakes in the andesite, which was bleached and mineralized where they traversed it. It was a curious feature of this mine, and of the Guston also, that the short, very rich bonanzas of the upper levels gradually lost their definition, that is to say, they became no richer than the intervening portions of the lode. This was interpreted as a "lengthening" of the ore shoots, which may be true, viewed in one way; but I think that it should be more properly regarded as an impoverishment of the lode, marked by a disappearance of the bonanzas. The surface waters of these mines are very acid, Mr. Emmons remarks. At the Yankee Girl mine it became necessary to encase the pipes in redwood, brought from California. I found that the water issuing from a shallow adit (73 feet below the collar of the shaft) readily precipitated copper on scrap iron. Ore forming agencies were evidently still at work.

(TO BE CONTINUED.)

The Lightner Chlorination Mill, Angels, Cal.*

Written for the MINING AND SCIENTIFIC PRESS.

The Lightner chlorination mill, recently completed and started operating, is a very complete and up-to-date plant. It is situated adjacent to the Lightner mine. The building is 48x185 feet. The floors are made of concrete. The sulphurets floor is elevated to the level of the hearths of the roasting furnaces.

The cooling floor is 18 inches below the hearth level, and the leaching tubs are set on a floor 40 inches below the cooling floor, thus avoiding the elevation of the sulphurets at any stage of the process. Below the leaching floor there is an intermediate floor which is used for the solution tanks. The precipitating floor there are two drains, each 4x4 inches, running into an outside tank, which is used as a filter. After passing through this filter the solution is run into a large settling vat, the method employed effecting a very perfect saving.

The stack is 60 feet high, with two compartments, providing in advance for a second roasting furnace. The furnace is 12x87 feet by 7 feet outside, and the fumes pass from it into a dust chamber, which has four quarter turns. Owing to the scarcity of surface water the mine water is pumped to the plant, a distance of 1500 feet, by a triple-plunger pump, having a capacity of 3000 gallons

per hour. The water from the mine has been found by experience to give a more satisfactory extraction than surface water. The operation of the plant requires the services of six men.

A tramway is being built to convey the sulphurets from the stamp mill to the chlorination plant. Electricity will be used to operate it. The capacity of the plant is five and one-half tons every twenty-four hours.

*See illustrations front page.

New White Lead Process.

The new process is the invention of J. W. Bailey. Its product, as in the old Dutch process, is carbonate of lead. The only material difference between the two processes is that, when the new treatment is ended, the blue lead is entirely corroded, five days only having been consumed in the process and no crystallization has occurred. The pig lead is melted exactly as in the old process. It is driven from the melting pot by the force of its own gravity through a short horizontal nozzle, as in the former case; but, instead of running out into the waffle-shaped buckles, it is forced through a thin steel plate, in which the horizontal nozzle is made to terminate, the steel plate being perforated with about 200 minute holes not more than $\frac{1}{16}$ of an inch in diameter.

There thus falls into the air, cooling immediately, fine metallic fiber which, dropping upon trays holding about fifty pounds of fiber, permits free circulation through the entire masses, which are passed swiftly through an 8% solution of acetic acid and then stacked. The entire process is mechanical and auto-

*Trans. Am. Inst. M. E., Richmond meeting, February, 1901.

matic, effecting a great saving of hand labor. The carbon dioxide has to operate upon a minute lead fiber instead of upon a large, thick buckle. Practically, the exposed lead is all surface. Every particle is reached by the gas immediately, and in four or five days it has been entirely corroded. There is no blue lead remaining, and the further process or separation by which under the old method the crystallized particles must be removed, is unnecessary. Under the most careful microscopic examination, nothing is disclosed in the Bailey process except pure white lead and that 2% or 2½% of water which is a necessary ingredient of the best white lead product.

The economics thus accomplished are enormous. The total cost of manufacture by the Dutch lead process averages from \$13 to \$18 per ton of dry product. The new process averages something less than \$5.—The Lead and Zinc News.

Mining and Metallurgical Patents.

Patents Issued July 9, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

PROCESS OF MINING COAL.—No. 677,880; E. C. Morgan, Chicago, Ill.

The process consisting in blocking out in coal vein a sufficient amount of coal to fill a car, by forming horizontal and vertical kerfs, then running a movable platform or car under blocked out coal, loosening it and letting it down directly into movable platform or car.

MINING MACHINE.—No. 678,045; W. Seltner, Schlan, Austria-Hungary.

A movable platform, a telescoping cylinder, a telescoping rotatable pole or rod, carried by telescoping cylinder, a cutter head carried by pole or rod and geared thereto, means for rotating telescoping cylinder for projecting and retracting pole or rod with cutter head, and means for rotating pole or rod to operate cutter head.

APPARATUS FOR DESULPHURIZING ORES OR OTHER SUBSTANCES.—No. 678,078; J. P. Wetherill, South Bethlehem, Pa.

The method of roasting by furnace heat a progressively moving or advancing charge of ore containing sulphur, which consists in excluding products of combustion of heating furnace, admitting air at an initial portion of ore and partially oxidizing sulphur

thereby, maintaining roasting temperature along an advance portion of charge by combustion of sulphur, withdrawing sulphur fumes at advanced portion so as to prevent them from passing on over remainder of the ore, and finally admitting sectional quantities of air to oxidize the sulphur in portions of charge still further advanced.

MINING DREDGE.—No. 678,147; W. T. Urie, Kansas City, Mo.

A dredge boat, and alternating cable winding and unwinding drums thereon, and separate cables having free ends extending in opposite directions and laterally from forward end of dredge boat, and connected with suitable fixed points, separate vertically-movable boat-anchoring spuds or spars connected with rear end of dredge boat and adapted to be lowered in position alternately, a main power shaft, and an engine and its driving shaft, power conveying devices connected with driving shaft of engine and main power shaft; a separate, horizontal shaft upon boat, actuated by main power shaft and a vertical power-transmitting shaft connected with and actuating drums carrying cables, and friction gear connecting horizontal and vertical power-transmitting shafts.

AMALGAMATING APPARATUS.—No. 678,183; A. H. Jocelyn, Brooklyn, N. Y.

A framework; an inclined, shiftable trough carried thereby and having a pair of discharge mouths and shiftable to deflect material discharged therein into opposite direction; a removable hopper carried by framework and having a discharge mouth at lower end opening above shiftable trough intermediate discharge mouths thereof; a rotary drum supported by framework for rotation in hopper, and comprising a pair of end walls, a series of radially-extending apertured crossbars connecting end walls, shiftable cover and differential mesh screen periphery, mesh being larger at exterior than at interior; and a water-discharge conduit above drum and in position to discharge into drum during rotation.

PROCESS OF TREATING COMPLEX ORES.—No. 678,210; J. W. Worsey, St. Helen's, England.

Process for the treatment of complex sulphide ores comprising first reduction of combined sulphur below 15% by calcination; secondly, finely powdering calcined ore; thirdly, adding sodium nitrate; fourthly, boiling mixed ore and nitrate in dilute sulphuric acid; fifthly, roasting semi-solid mass in a closed furnace; sixthly, dissolving out zinc, copper and other soluble salts from mass by weak sodium-sulphate solution;

seventhly, removing any copper from solution; eighthly, precipitating zinc and other metals from solution; ninthly, separating zinc.

CENTRIFUGAL PUMP.—No. 678,198; J. Richards, San Francisco, Cal.

An annular discharge chamber, an uninclosed rotary disk impeller mounted concentrically therein, divergent vanes with impeller forming between them passages expanding toward periphery in plane of rotation, vanes terminating a short distance within periphery of impeller to form an annular continuous discharge way at margin thereof, and continuous annular throatway on surrounding discharge chamber co-operating with discharge way.

Wet Extraction of Copper.*

By C. C. LONGBRIDGE.

This method is applied to: (1) Ores that are too poor to smelt, under favorable conditions, to ores with as little as 1% to 1½% of copper; and (2) products containing copper, silver and gold.

The ores amenable to wet treatment include: (a) Copper in the form of oxide, carbonate, sulphate and phosphite, or arseniate, can be dissolved by cheap solvents, such as ferric sulphate. (b) Copper in the form of sulphide, admitting very slow and imperfect extraction by cheap solvents, has first to be converted into a sulphate or a chloride, soluble by cheap solvents, such as water, hydrochloric or sulphuric acid, or metallic chlorides.

In all cases the copper is precipitated, as metallic copper, by means of iron; or exceptionally as sulphide by sulphuretted hydrogen; or as hydrated oxide, by suboxide. The iron is usually metallic, wrought iron, pig iron, sponge iron, bears, etc. Tin-plate clippings also can be used; if the copper is in solution as chloride, the tin can be separated as oxide.

(1) Dealing with the above more in detail, it may be said that for ores containing oxide or carbonate of copper, such as ores of cupric oxide, azurite, malachite, arseniate of copper, the solvents used are sulphuric acid, hydrochloric acid or ferrous chloride. The two former are very energetic, and, if low in price, should be used in preference to the slower ferrous chloride.

A necessary condition for the employment of acids is that the ores should not contain notable quantities of other bodies, especially carbonates, soluble in acids. Carbonates, other than those of copper, are prejudicial also to the use of ferrous chloride. Regarding the action of these various solvents it is noteworthy that:

(a) Sulphuric acid readily dissolves cupric oxide, azurite, malachite and arseniate of copper; somewhat less readily, phosphate of copper. The acid is applied as such, or as sulphur dioxide, nitrous fumes and water vapor.

(b) Hydrochloric acid is preferable to sulphuric acid, as it is less liable to form basic salts. The solutions, therefore, contain little free acid, and thus require less iron to precipitate the copper than solutions containing sulphate of iron. On the other hand, hydrochloric acid attacks oxide of iron more energetically, and, accordingly, is less suited for treating ores with much ferrous oxide.

(c) Ferrous chloride is suitable for cupric oxide or copper carbonates; cuprous oxide may be treated, if first converted into cupric oxide by ignition in the presence of air. The original Hunt-Douglas process has been modified by dissolving the copper by dilute sulphuric acid, and then adding ferrous or calcic chloride to the solution. This method has the advantage that ferric hydrate is not formed, nor is silver dissolved by the weak sulphuric acid, and the copper precipitation requires little iron.

(d) Ferric sulphate may be used in combination with sulphuric acid.

(2) For ores, mine water, etc., containing copper as sulphate, the copper is precipitated from solution by iron. Sulphuretted hydrogen may be used, when iron is not obtainable. The precipitated (cemented)

*Trans. Institution of Mining Engineers, London and Newcastle-upon-Tyne Dec., 1900, meeting.

copper, sulphide of copper, is dried in filter presses, and either roasted in the English reverberatory or converted by hot-air blast into oxide, and then smelted for coarse copper.

(3) For ores containing copper as sulphide, the first operation is to convert this into soluble sulphate, or oxide, or chloride. The first transformation is effected:

(a) By weathering, without calcination. This natural oxidation is prompted by repeated leaching, pouring over the heaps the acid ferric-sulphate liquors, left when the copper is cemented. Generally several years are needed to obtain even a moderate proportion of copper in the form of sulphate. The extraction is somewhat imperfect and capital is locked up for a long time.

(b) By slow calcination. Such calcination requires the ore to contain proportionately large amounts of iron pyrites and small amounts of copper pyrites. After calcination and leaching, the heap is allowed to weather, so as to convert the residue into sulphate. If the ores are free from gangue, do not decrepitate, and have sufficient copper, the roasting is so conducted as to concentrate the copper sulphide in a kernel, while the sulphate remains in the porous crust, consisting chiefly of iron oxide, and is leached out. The kernels are smelted.

(c) By calcination with sulphate of iron or other easily decomposed sulphates, such as sulphate of alumina, thus converting the greater part of the copper into sulphate. The calcination is done in heaps. The ore, say, a poor copper pyrites, is crushed fine, made into a stiff paste with cementation liquors containing sulphate of iron, molded into bricks, dried and built up into heaps. The leaching is done with cementation liquors from which the copper has been precipitated.

(d) By treating the ore with nitrate of iron (Perrino process).

(e) By treating the ore with ferric-sulphate solution—a method proposed for decomposing sulphide of copper for electrolytic extraction.

The second conversion, namely, the transformation of copper sulphide into oxide, is effected by calcining the crushed ore.

The third change, namely, the conversion of sulphide into chloride, is effected in the wet way, by treating the ore either with ferric or ferrous chloride and hydrochloric acid. The process is slow, and advisable only when fuel is dear, or the fumes of a chloridizing roast cannot be allowed to escape into the air. The conversion of copper sulphide into chloride by ferric chloride is applied at Rio Tinto to cupriferous pyrites, with about 2.68% of copper, and is there known as the Doetsch process. The result is cupric and cuprous chloride dissolved in ferrous chloride, and ferric chloride. After precipitation by iron, the ferric chloride is regenerated by iron. About 1.34% of the copper is converted into chloride and leached out in four months. Of the rest, 0.86% of copper is extracted in two years more, and the residual 0.48% of copper is lost. Attempts have been made at Rio Tinto to shorten the chlorination by first digesting the ore with ferric chloride in vessels, and then treating it in heaps. As the Doetsch process only slightly attacks iron pyrites, the leached ore can still be used for sulphuric acid manufacture. In dry chlorination, the calcination should be conducted so as to produce the minimum of copper oxide and cuprous chloride, as these, being insoluble in water, require to be leached by acids. The necessary conditions for this method are that the sulphur does not exceed $1\frac{1}{2}$ times the equivalent of copper present, otherwise too much salt must be used and the calcination too much prolonged. Again, the ore must not contain more than 6% to 8% of copper, otherwise the whole of the sulphide will not be decomposed. Lastly, the temperature must not exceed low redness, otherwise too much cupric chloride would be volatilized.

COPPER ORES are not treated by the wet method in Tasmania, nor concentrated previous to smelting. The principal smelter is at Queenstown, belonging to the Mount Lyell Co., where copper ores, averaging 2.48% copper, 1.95 ounces silver and 0.074 ounce gold per ton, are treated by the pyritic smelting method. Two sets of furnaces are in blast, one comprising six, the newer addition five. The size of the second nest of furnaces is large for copper smelting, viz., 210 inches by 42 inches in the clear of the hearth; the height from tapping floor to charging floor, 20 feet; the number of tuyeres, forty. The blast is heated by four hot-blast stoves, in two sets. The power blast consists of six boilers of 125 H. H. each and five vertical compound condensing engines, each coupled direct by a flexible coupling to a No. 8 Roots blower. The disposal of slag is conducted by means of granulation.

An Appreciated Testimonial.

This paper is in constant receipt of kindly expressions from its patrons as to the value to them of their advertisements. The readers of this paper have bought mining machinery and supplies to the extent of over \$150,000,000 in the last ten years, and their annual purchases now approximate \$20,000,000. Its advertising pages are referred to everywhere by intending purchasers of mining machinery or supplies

as a directory for that purpose, and advertisers everywhere find an advertisement in its columns not an experiment but a paying investment; for, in advertising, it is results that count. It is not what an advertisement costs, but what it produces, that determines its value. Some time ago Mr. Chas. F. Hendrie, of the Hendrie & Bolthoff Manufacturing & Supply Co. of Denver, Colo., gave the publisher of this paper the subjoined, an unsolicited testimonial, which is prized. Mr. Hendrie's kindly expression of fact is herewith reproduced:

Denver, Colo. April 19, 1901.

Mr. J. F. Halloran,

Publisher Mining & Scientific Press,

San Francisco, Calif.

Dear Sir:—

I think it is but due to the Mining & Scientific Press to briefly express our appreciation of the value to us of the advertisement in your paper. We know from our own knowledge that the results are largely due to the class of subscribers to whom your paper is mailed, and we want further to state that your continuous efforts to secure subscribers rather than advertisers, is one which should meet the approval of advertisers.

We have had excellent results from our advertising, and in increasing the space do so because it pays.

Yours very truly,

The Hendrie & Bolthoff Mfg. and Supply Co.,

By *Chas. F. Hendrie Treasurer*

Electro-Vapor Launches.

Considering the almost unlimited possibilities furnished by the inland and coastwise waters of North America for the use of light craft, either for pleasure or profit, and the rapid progress that has been made in the construction of light and powerful motors during the decade just passed, the evolution of the staunch, graceful and swift gasoline launch comes in natural sequence. The accompanying picture shows a 28-foot-cabin launch now in use on St. Andrews bay,

Florida. These launches are extensively used, both for outing and business purposes, not only in the United States, but in many other parts of the world. They are built of best selected material, and are considered reliable. The electric-vapor engine built by this company is a special feature, durable, compact and simple and economical in operation. The boats range from 15 to 50 feet in length, the prices varying with size and general style of finish. Baker & Hamilton, San Francisco, are the sole agents for the sale of these launches in California and the Orient, and carry them in stock for immediate shipment.

Electro-Vapor Launch.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

CALIFORNIA.

ALPINE COUNTY.

A test run on 500 tons of ore from the Lewis mine at Gardnerville was so satisfactory that arrangements are now being made to increase the number of stamps to twenty. A contract has been let to get out 500 cords of wood.

CALAVERAS COUNTY.

The Beatrice mine, formerly owned by T. J. Matteson and J. E. Matteson of Murphys has begun operations. A Morgan is Supt.

EL DORADO COUNTY.

A. Lauer has discovered what he claims is tin near Michigan Flat, and says that the deposit, which is rich, is so large that many years would be required to work it out.

INYO COUNTY.

The Reward G. M. Co. at Independence are investigating the mountain streams to find a water supply and site for an electric power plant.

KERN COUNTY.

Rich ore has been struck in the Trilby mine, Yellow Aster group, at a depth of 1120 feet.

The 30-stamp mill of the Yellow Aster Co., which has been shut down for repairs, has been started up again. The condition of the mine and the facilities for getting ore to the mills is considered such that 500 tons of ore daily can be supplied to the two mills.

MONO COUNTY.

The South End Tailings Co. has bought ten stamps at Mammoth from J. S. Cain and will build with them a custom mill at Bodie adjacent to the company's cyanide plant.

NEVADA COUNTY.

H. Diener, manager of the Daylight mine near Maybert, is preparing to start the mill. A flume 2000 feet long has been built to bring power to it. The ledge is about 2 feet in width and the ores prospect well.

W. Tiernan and H. Diener are developing the Gray Eagle mine at Maybert. It is proposed to erect a new 10-stamp mill on it.

C. J. Schuster, the superintendent of the Grizzly Ridge mine, purchased the Live Oak and Minnett mining claims, at Columbia Hill. A 10-stamp mill is part of the property bought. It is reported that a large chlorination plant will be erected on the Live Oak property.

The Jenny Lind G. M. Co. has bought the pipe line of the Murchie mine at Nevada City, which will be moved to the Jenny Lind mine at Grass Valley and used as part of the power plant to run the new mill.

The Tule Belle mine, at Grass Valley, is being reopened. A new hoisting rig and a new engine have been installed. A shaft is 180 feet deep and sinking will be resumed. The mine is owned by Grass Valley people.

At the Lecompton mine, Nevada City, steady production is kept up. Twelve tons of smelting ore shipped produced \$2400. The incline is being sunk and is now down about 300 feet.

Supt. C. Graham of the Bellfountain mine in Willow valley, near Nevada City, says that the water has all been pumped out of the incline shaft. Sinking has been recommenced at the 350-foot level and will be continued to the 450-foot level.

At the Mistletoe mine at Rough and Ready sinking is being continued. Some fine ore has been taken out of the mine in the upper levels. The rock is heavily mineralized and much of it has to be worked by smelting.

Work at the Pennsylvania mine is suspended until the decision in the suit with the Grass Valley Exploration Co. is rendered by Judge Morrow. About seventy men had been employed.

SAN LUIS OBISPO COUNTY.

A streak in the 80-foot vein of cinnabar ore in the Rinconada quicksilver mine, near Santa Margarita, has been struck. The ore is thought to carry about 1% quicksilver.

SHASTA COUNTY.

J. O. Welsh of Mott, Siskiyou county, has bonded the Live Oak mine, near Shasta, to Shasta miners, who will ship ore to the Keswick smelter.

W. Arps of Copper City has bonded the Red Cloud and Ontario copper prospects in Copper City district from M. Renaud until July 2, 1902, obligating himself to prosecute development work on the property.

F. E. Ware, general superintendent of the Mount Shasta Mines Co., says the company are negotiating to buy more

land adjoining their property near Shasta. They have bought from J. Kahny, D. Lees and others a quarter interest in 120 acres of land on Clear creek. It is said the company desire these properties to put in a power plant on Clear creek to furnish power for the mill and machinery to be installed at the Mount Shasta mine.

The Clipper mine on Squaw creek, near Kennett, owned by A. Di Nola of San Francisco, is to be reopened immediately. The property has been shut down by litigation. J. H. Walkotte will be the foreman. The old workings will be cleared out and re-timbered.

SIERRA COUNTY.

J. W. Belcher and other San Francisco parties owning the Towle mining property on the Monte Cristo ridge, near Fir Cap, have resumed operations.

SISKIYOU COUNTY.

The King Solomon mine of the South Fork of Salmon river, Cecilville, operated by J. A. Thompson, is running steadily.

TUOLUMNE COUNTY.

L. Chappelle, Supt. of the Mohican M. Co. at Carters, says the company will erect a 5-stamp mill, the contract having been let. It will be run with a gasoline engine.

The Longfellow mine, near Sonora, is closed down and the pumps have been taken out. The Nonpareil mine, belonging to the same company, is being operated.

J. H. Rogers of Carters reports that he and his partner have bonded to C. D. Lane the Fleming mines, situated on the line of Mariposa and Tuolumne counties. Operations will be commenced on the property in September.

The Jones mine, situated near the Shawmut, is shut down at present, but the company which has bought the property will, it is said, soon start work on a large scale and put up a mill.

COLORADO.

CLEAR CREEK COUNTY.

The Denver & Salt Lake Railway, Tunnel & M. Co., capital \$5,000,000, has incorporated to tunnel under Argentine Pass. The incorporators are: H. W. Hannum, J. J. Reilly, L. N. Collis and D. J. Kelley, of Denver, Colo., and J. E. Ratchford of Syracuse, N. Y. Other New York State capital is also interested, and the objects of the company are to build a railroad through Clear Creek and Summit counties, and do a general mining business in the same locality.

J. Carozza, W. T. Jacoby, H. Kneisel, R. M. Stearns and R. M. Richardson have incorporated the General Hooker T. & M. Co., with capital stock \$1,000,000, to operate the old Pickwick properties on Saxon mountain, Georgetown. The Pickwick in the early days produced a large amount of high-grade ore.

E. F. Welles, manager for an Eastern company, has commenced work on the well known Conqueror, at Empire.

FREMONT COUNTY.

The United States R. & R. Co., it is said, will commence shortly to concentrate the huge dump of tailings at the Metallic Reduction Works at Cyanide. It is estimated that there are fully 750,000 tons of tailings of average value of \$2 a ton. A big concentrating plant is to be constructed, work on it to start at once.

HINSDALE COUNTY.

L. Le Fevre of Lake City has bonded the Macaboy and Denver lodes at Silverton to R. V. Hopkins at \$13,000, until January 1, 1903.

LAKE COUNTY.

The La Plata G. M. & M. Co., organized to operate the Mountain Quail group on Mount Estabrook, Twin Lakes, near Leadville, has begun work; A. J. Stanley of Colorado Springs, manager. The incorporators are J. F. Murray, I. E. Townsend, A. D. McKay, J. Watts and a Mr. Thomas, all of Colorado City.

A shipment of ore has been made from the President mine, on Brece hill, Leadville. The sampling indicated five ounces gold and 28% bismuth, giving the ore a value of about \$600 per ton. The bismuth is figured at \$28 per unit, the price heretofore, but quotations are stated now to be \$10.

A 6-foot vein of low-grade magnetic iron and gold-bearing honeycomb quartz has been discovered on the summit of Prospect mountain in claims owned by the Mansfield Brothers of Leadville.

MINERAL COUNTY.

Creede shipped 6194 tons of ore during June. The Holy Moses has resumed shipments for the first time since 1895. The Ethel mine is handling 40 to 50 tons of zinc and lead base ore daily.

OURAY COUNTY.

The Micky Breen mine and mill at Ouray have started up after being closed down since 1893.

D. Sullivan has bonded the El Mahdi,

and, it is said, proposes to expend \$20,000 in equipping and developing the property.

N. West has contracted to build a mill on Canyon creek, near Ouray, to work the tailings of the Camp Bird and other mines. It is claimed that a valuable waste flows down the creek from these mines that will be recovered by this mill.

SAGUACHE COUNTY.

A strike is reported to have been made in the Crestone district upon the Copper King group, owned by J. D. O'Brien and J. W. Davies. A 5-inch streak of high-grade copper ore has widened to 16 inches and runs 30% copper and \$11 gold.

SUMMIT COUNTY.

The Gold Run M. & M. Co., at Breckenridge, is constructing a power line, and the machinery, power and light will be supplied by electricity. Col. Lightburn of Cripple Creek is manager.

TELLER COUNTY.

Ore has been discovered in the Last Dollar at a depth of 1150 feet. Values are sufficient to satisfy the management of the existence of pay ore at that depth.

The Dexter Co., at Cripple Creek, has decided to do the work of exploration itself, commencing on block No. 1, where the last lessees sunk the shaft to 300 feet. The company will make the shaft 500 feet deep, crosscut to the vein and drift to blocks Nos. 2 and 3.

The Independence Con. M. Co. has granted King & Whiting a new lease on their block. The shaft, now down 700 feet, is to be continued to the 800-foot point.

A. J. & T. Finnerty of Cripple Creek have taken an eighteen-months' lease on the St. Thomas G. M. Co.'s property on Beacon hill. The lease requires seventy-five shifts a month, 25% royalties and 50 feet of continuous sinking.

A record-breaking speed is claimed in timbering the shaft of the Legal Tender mine. The timbermen have retimbered to a depth of 300 feet in a little over seven days.

A discovery of quicksilver is reported in the Oil creek region of the Cripple Creek district; whether of commercial value or not is yet to be determined.

IDAHO.

The Northern Star M. Co. has incorporated, to operate mines in Idaho, with an office in Spokane, Wash., and another at Indianapolis, Ind.; capital, \$1,000,000; trustees—H. D. Yoder, H. S. Rominger and G. S. Warren of Indianapolis, Ind.; F. Chestman of Greenburg, Ind., and W. H. Plummer of Spokane, Wash.

BANNOCK COUNTY.

The Pittsburg G. M. Co., S. F. Hunt manager, at Soda Springs, has contracted for the erection at once of a quartz mill of fifty tons daily capacity.

The gold mines of M. Mahnken and his associates at Soda Springs are to have a 10-stamp mill, with foundation for such additions as may later be required.

BLAINE COUNTY.

A strike has been made near Martin of a ledge from 12 to 20 feet in width, the croppings of which are said to prospect for a distance of 1600 feet in free gold, much of it coarse.

IDAHO COUNTY.

The Midas G. M. Co. has explored the Ajax property at Grangeville and is reported to be waiting the construction of a mill, to be installed as soon as possible. One of the ore shoots is said to be from 4 to 20 feet wide and to have an average value of about \$22 per ton.

The Wilkinson strike at Pierce City is proving richer than at first supposed. Test pits dug, exposing the vein for nearly 200 feet, show it to be from 10 inches to 3 feet in width and very rich in free gold.

W. A. Stevens, foreman of the mining syndicate's operations at Buffalo Hump, states that there are now twenty men employed in the Vesuvius, and that the best present showing is in the Jumbo, which has a large body of ore with values ranging from \$28 to \$30 a ton.

LEMHI COUNTY.

The bond on the Chicago and W. J. Bryan lodes, in the Blackbird district, held by the Franklin Syndicate, has been taken up by the payment of \$21,000. The new owners say that at 300 feet the value and extent of the ore bodies are highly encouraging. Mr. Fitzwater is Supt.

OWYHEE COUNTY.

R. Noble and his partner have found a ledge 8 feet wide and ore that runs over \$100 a ton near Silver City.

SHOSHONE COUNTY.

A. Andrieux has located a group of claims near Mullan. He has nine claims in all, covering all the ground on which the croppings could be found. He describes the vein as showing from 75 to 100 feet wide, and for about 1500 feet good ore

can be found. He has had a number of assays yielding from 5% to 17% copper, eight to fifteen ounces silver and about \$4 gold. A tunnel has been run about 40 feet, all in ore, and some shallow shafts have been sunk on it.

The Chloride Queen Co., at Wardner, have a 500-foot contract on their lower tunnel, half of which will be drifting on the vein.

The Pawhatton M. Co. has resumed work on its mine near Wardner, a contract for an extension of the tunnel having been let.

WASHINGTON COUNTY.

W. Sweet, representing Boston people, has bought the Missouri group of mines in the Thunder Mountain district for, it has been stated, \$50,000.

MONTANA.

BEAVERHEAD COUNTY.

The Polaris M. Co. has incorporated, with J. E. Rickards, J. MacGinnis, A. H. Wetthey, G. H. Robinson, A. J. Huenke, J. K. Heyset and W. C. Jones as directors; capital, \$250,000. The company will operate the Polaris mine.

Judge Dennis of Dillon is operating the Indian Queen mine on Birch creek, doing development work for Eastern people, who have a bond on the property.

BROADWATER COUNTY.

J. Keating of Radersburg, operating one of the old mines there, is now shipping base ore and concentrates to the smelter. He contemplates the erection of a cyanide mill to treat the latter.

A consolidation of all of the properties in the Neihart district owned by L. S. McLure is made by the St. Louis & Montana Co. Included in the consolidation are the Broadwater mines and the Diamond R. Con. Co.

FERGUS COUNTY.

A. J. Schumaker, of Butte, is bonding copper prospects on Wolf creek. It is said to be his intention to organize a company to build a smelter and work the mines.

FLATHEAD COUNTY.

J. H. Geiger of Libby has organized the Illinois & Montana G. M. Co., capital \$1,000,000, to develop the claims owned by the company and to equip them with machinery. The claims bought by the company are in Fourth of July gulch in the West Fisher district, 40 miles south of Libby. It is the intention of the company to erect a 10-stamp mill. The ore is estimated to average about \$10 a ton. J. H. Geiger is manager.

JEFFERSON COUNTY.

A half interest in the New Stake, Columbia, Dorothy and Erma quartz claims, near Clancey, has been bonded by J. Wols to F. A. Koetitz of San Francisco, \$1000 being paid down. A. P. and F. J. Meng of Clancey will join Mr. Koetitz in the development of the group.

LEWIS AND CLARKE COUNTY.

(Special Correspondence).—The Montana Standard M. Co. has been organized by Butte people. P. T. Davis is president, M. L. Borglum treasurer, and W. H. Lindsay secretary. The company has a group of nine claims at Marysville. Six of these are on Cruse hill in the vicinity of the Drum Lummon. The other three are on Standard mountain, north of Silver creek. The first group has a ledge of ore running in a northerly and southerly direction through a lime and slate formation. The work thereon consists of two tunnels—one running 200 feet and the other 720 feet along the strike of the vein. The group on Standard hill has an east and west vein, with a lime-quartz gangue, carrying gold capable of free milling. The development here is through two shafts—85 feet and 105 feet, respectively—which go down in ore. There is other work consisting of open cuts and tunnels. The ores are generally free milling, carried in good widths of veins. The management propose to continue development and will put in a compressor for power drills.

Marysville, July 10.

Miller & Burke have struck a pocket of ten pounds of gold nuggets in a shaft on Greenhorn gulch. They bought the claim for \$500.

MADISON COUNTY.

J. P. Reins is working the Elizabeth mine, near Rochester, and the shaft is down 100 feet. The vein is 4 feet wide and the ore is said to average \$25 gold per ton. It is sorted and shipped to the smelters.

PARK COUNTY.

The sixth vein has been struck in the Revelation lode of the Bear Gulch M. Co., at Jardine. The new strike is about 400 feet deep and 800 feet in the tunnel. The vein is 30 feet thick and the ore, rich in gold, also carries copper and iron. A 100-stamp mill and cyanide plant are projected. The present mill consists of twenty 1000-pound stamps, two Hunting-

ton mills and twelve concentrators. A 60 H. P. engine furnishes steam power when the water power is short; M. Quinn is mill Supt.

C. R. Murdoch of the Standard M. Co., at Contact, reports the mill of the Milwaukee Co. to be in operation and that ground is being broken for the erection of the 5-stamp Standard mill. The Standard has completed its road to the mine.

SILVER BOW COUNTY.

The Minnie Healey mine at Meaderville, now under control of F. A. Heinze, has been started up with a crew of sixty men. J. MacGinnis, of the Montana Ore Purchasing Co., says the number will be increased to a total of 200 or 300 men.

The Speculator mine, at Butte, is becoming involved in litigation. A suit for \$2,000,000 damages has been brought against the owners of the mine by J. A. Murray, who alleges that the rich ore mined through the Speculator has come from a vein that apexes in the Ticon and Adirondack lode claims, owned by him.

TETON COUNTY.

(Special Correspondence).—The Swift Current mining district is on a river of that name. It is 100 miles northeast of Kalispell, but is nearer to Browning station, on the Great Northern. Prospecting and a little development there has uncovered ledges of borite copper ore. One group of claims here is being developed by the Michigan-Montana C. M. Co., organized by Kalispell people. They report having done 1000 feet of work and have built a concentrator. They claim the ore mines 8% copper. A. Moore is Supt. Choteau, July 6.

NEVADA.

LANDER COUNTY.

The New Pass gold mines, at New Pass, have been bonded by W. F. Snyder at \$250,000 from P. T. Farnsworth and F. C. Mitchell until Jan. 1, 1902. He paid \$30,000 on account and is operating the property with F. Mitchell as Supt. Several thousand feet of openings have been made underground. A mill of large capacity will ultimately be required.

LINCOLN COUNTY.

The Bristol C. M. Co. are reported to have secured all claims lying and adjoining their copper property, at Bristol. W. Gelder of Denver, Colo., is the president and manager of the company, and contemplates starting the smelter at Pioche and to run two stacks, one of which will be used for the treating of custom ore. The company have completed a 100-ton ore bin on the May Day, and the machinery for the hoisting engine is being put in place.

LYON COUNTY.

L. H. Rogers, one of the parties interested in the Cuyahoga M. Co., operating in Smith valley, near Wabuska, states that his company is about to establish a pneumatic cyanide plant at the Cuyahoga mill to work the tailings.

WASHOE COUNTY.

The Cabin No. 2 mine, at Olinghouse, owned by S. Francovich, L. D. Piazzi and A. Donduro, is being operated. A shaft has been sunk 300 feet and levels run, from which rich ore is being taken out. They have a mill on the ground working on ore which will go from \$75 to \$80 per ton.

WHITE PINE COUNTY.

An accidental discovery of a possible mine has been made by A. Topiani, who had secured a contract from the Glasgow mine at Cherry Creek to supply it with wood. To cut it he had to locate a claim and sink to a depth of 10 feet. He had scarcely broken ground when a ledge of quartz showing gold was struck. An assay showed several hundred dollars a ton value, and the lucky woodchopper has sunk on the vein to a depth of 65 feet in the same class of ore.

NEW MEXICO.

GRANT COUNTY.

A rich copper strike is reported from the Burro mountain mining district upon a mine owned by Jones & Downes of Silver City. They have taken out some ore that assayed 75% copper.

SOCORRO COUNTY.

R. A. Mulvihill, M. L. Thorsell and L. M. Lasley have incorporated the Golden Bell M. Co.; capital, \$100,000; office at San Marcial.

OREGON.

BAKER COUNTY.

The Gem G. M. Co. has been incorporated by W. L. Patterson, A. T. Hendryx and A. Geiser of Baker city; capital, \$300,000.

J. C. Armstrong of Ogden, Utah, has made the final payment of \$14,000 for the King B. placer mine, near Sumpter. The ground bought is said to average 60 cents

to the cubic yard, but will require considerable outlay before it can be worked to advantage. D. Ensign of Ogden will be associated with Armstrong in the operation of the mine.

President A. J. Willet of the Cornucopia Copper Co. states that the company will soon begin larger operations on the mine at Quartzburg; also that he will soon make a visit East for a matte smelter and other machinery.

GRANT COUNTY.

(Special Correspondence).—Six miles from Sumpter, toward Granite, is the Red Rock group, which is under development by Dan Jaeger and others of Montana. Present development consists of sinking a 250-foot shaft on a lead of ore that runs nearly east and west in a slate formation, between belts of granite and porphyry. The ore encountered is a sulphide of iron, carrying \$3 to \$4 gold.

The Oregon Placer & Power Co. have about 200 acres of placer ground on Grey's creek, a branch of Granite creek. The source of water supply is Boundary creek, at the foot of Bald mountain. They have 7 miles of ditch, 1340 feet of wood flume, 2000 feet of pole race and 1150 feet of pipe line. Their claims extend along Grey's creek to a bench, where there appears to be an ancient river channel 500 feet wide, the wash said to be about 40 feet deep. In general, the placers here are said to contain little clay, not many boulders and no cement. Their water system gives 218 feet pressure. A portion of the ground worked last year is stated to have run 28 cents per cubic yard. At present two giants are at work. As the water supply is short in midsummer, the intention is to construct a storage reservoir at the upper end of the property. Work began for the season on April 10, and it is expected they can work up to October 30.

The village of Granite is 14 miles west from Sumpter, on Granite creek. Two miles below Granite Clear creek joins it, flowing from the western slopes of the main mountain range that trends in a northerly and southerly direction. Going up Clear creek and its various affluents leads you through the Red Boy and Alamo districts, and to the Red Boy, Concord, Alamo, Quebec, Scandia, St. Anthony, Belcher, Strasburg, Oro Fino and other mines. These are all on the western slope, which drains into the John Day. On the opposite or eastern slope is the Bonanza, where the ravines and canyons drain into the Powder and Burnt rivers and those into the Snake.

The Alamo, which is being developed by a Spokane company, is in charge of J. P. McGuigan. Its location is on Quebec mountain, which is the center of considerable activity. The veins here run north and south in slate. They carry a gold-bearing quartz, banded with streaks of crushed slate and talc, with streaks of iron sulphurets, which probably increase with depth. Much of this ore horns free gold readily. Ores sampled are said to average \$8 to \$17 per ton. Development comprises two tunnels, one 90 and the other 600 feet long, with a shaft and some upraises. The lower tunnel is 200 feet below the upper and the two are being connected by an upraise in ore.

The Oro Grande, also on Quebec mountain, was recently bonded to Fred Kelly of Sandon, B. C., the amount named in the bond being \$20,000. This group comprises four claims.

On the western side of this mountain is the Quebec group, belonging to the Oregon-Colorado G. M. Co., composed of Oregon and Colorado stockholders, the work being in charge of Ferris & Carr, formerly of Victor, Colo. The development thus far is through a series of tunnels, one above another, which are driven on the strike of the vein. The lower or No. 1 tunnel is now in 300 feet and it will be driven 500 feet farther, where it will give a vertical depth of 700 feet under the crest of the mountain. No. 2 tunnel, 188 feet above No. 1, has been driven 650 feet. No. 3 tunnel is being driven on the ledge, but not in pay ore. Nos. 1 and 2 are connected by an upraise in ore, and a second upraise is being made from near the breast of No. 2. It is the intention to drive all these tunnels to a point under the crest of the hill. The vein walls are slate, the ledge matter being porphyritic in some places, carrying free gold-bearing quartz and iron sulphides. The quartz horns free gold freely and specimens are numerous in which the gold is visible. A 20-stamp mill is being erected 1500 feet from the lower tunnel. The mine and mill are to be connected by a wire rope tramway line.

The Scandia M. & T. Co. of Spokane has taken up the proposition of the Aldrin tunnel, to drive into Quebec mountain from the north side. The work has progressed 825 feet at present and it is destined to go in 3000 feet and cut the crest of the mountain at 1200 feet depth. This company has some surface holdings along the tunnel's course. W. Wade of Granite

is manager and Charles Johnson of Spokane secretary.

The St. Anthony group, of which L. G. Wheeler is manager, comprises seven claims, located on the east side of Clear creek. A crosscut tunnel has been driven northeastward about 300 feet, cutting several ledges. On the latter there are some 325 feet of drifting, showing a good width of vein, carrying gold quartz and sulphurets. The vein walls appear to be slate and porphyry. The volume of the creek here is sufficient to make it available for water power, and Mr. Wheeler states that he will utilize it as such. Sumpter, July 10.

J. F. Hardee, managing owner of the Climax, situated 3 miles north of Granite, says his property is making a splendid showing. The property consists of five claims, upon which much development work has been done. From the surface down, in all the showings the ore averages \$11 to the ton, with 4 feet which goes \$28. Mr. Hardee and associates have bonded the property to Spokane people, represented by C. R. Aldrum.

Groesbeck Bros. of Salt Lake City, Utah, who were grubstaked by M. I. Clausey and Christofferson Bros., have struck a blind ledge near the Ibox group. The ledge was found by trenching the surface.

Superintendent Thatcher of the Bonanza, Sumpter, states the June cleanup as being about \$70,000.—The Red Boy mine June cleanup amounted to about \$30,000.

JOSEPHINE COUNTY.

C. R. Ray of Gold Hill has temporarily shut down all work on the Braden mine and several other prospecting enterprises in and about Gold Hill.

H. W. Kirchoff has bought the Arnett placer on Biggs creek and will put on a hydraulic plant. The claims have been worked by ground sluicing.

MALHEUR COUNTY.

Development work to test the permanency and richness of the placer mines in the big bend of Snake river is to be begun at once on an extensive scale, using a diamond drill.

UTAH.

BEAVER COUNTY.

At the Copper King mines, at Milford, bought by the Franklin Syndicate of Salt Lake City, developments are reported at a depth of 110 feet, in a crosscut through 74 feet of copper-bearing ore. In this zone there are streaks of high-grade ore. The ores occur in the form of a carbonate at present, but with depth replacement with sulphides is anticipated, and will be followed, it is stated, by the construction of a smelter.

CACHE COUNTY.

The Lucky Star M. Co. has incorporated; capital, \$50,000; J. H. Anderson is president and L. P. A. Nielsen secretary of the company at Salt Lake City. The company owns the Sunshine and four other mining claims in Blacksmith Fork canyon.

JUAB COUNTY.

The directors of the Old Colony M. Co., at Tintic, have made arrangements for the immediate sinking of a shaft. C. Brown is manager.

PARK COUNTY.

The Crescent Hill Co. are reported to intend resuming active work at the mine at Park City. Some prospecting will be undertaken before the main work is begun and the pumps started up. H. G. McMillan is manager.

SALT LAKE COUNTY.

The Phoenix of Big Cottonwood, shut down for three years, is to be reopened, so F. H. Rehman, secretary of the company at Salt Lake City, says. Arrangements will be made with Eastern people for capital required for the work and to absorb several other properties in the locality.

SUMMIT COUNTY.

The old Hawkeye claims, on Lake Flat, are to be worked again after lying idle for nineteen years. At one time the property was equipped with a first-class plant, but it was stolen during the period the mine was shut down. J. T. Donnellan, who is starting up the property again, has ordered new machinery.

Active developments at the Silver Star M. Co., at Park City, have been under M. L. Hammer, president of the company. A shaft has been sunk 125 feet to the contact between the limestone and quartzite, which has been drifted on. It is the intention now to open up an ore streak on the contact by a winze.

UINTAH COUNTY.

W. D. Munday of Vernal has bonded four claims situated in Moseley park, to F. A. Keith of Salt Lake City, for \$2000. Work will commence August 2nd, and a 300-foot tunnel is to be run to reach the ore.

WASHINGTON.

FERRY COUNTY.

W. M. Ridpath of Spokane, who is interested in the Republic mine, does not expect the mine to reopen until a railway is built into Republic. The Republic ore has steadily shown more silver with depth, he is reported as stating. The change has destroyed the usefulness of the mill. It is an excellent gold mill, but he is informed that it only recovers about 35% of the silver values. Some of the Republic ore went as high as twenty-eight ounces in silver. Of course, no medium-grade ore could stand a loss in silver equal to \$11 a ton. Therefore the mine is closed. There have been four mills in Republic, costing nearly half a million dollars. All of them have proven unsuited to their work.

The Bodie mine, at Bodie, on Toroda creek, shut down for several months past, has resumed operations. W. G. Madison, president and general manager of the Bodie G. M. Co., states that he has let a contract to sink the 30-foot shaft 50 feet deeper. He has ordered the 450-foot tunnel advanced until it intersects the Bodie ledge close to the face of the tunnel.

OKANOGAN COUNTY.

Four feet of chalcopryite ore has been struck in the Rainbow at Bolster.—The second payment on the bond on the Copper Queen and No. 9 claims has been made and two shifts are at work on the property.—M. M. Walsh, Supt. of the Monterey G. M. Co., operating the Buckhorn, says the tunnel is in 600 feet.

SPOKANE COUNTY.

The Copper Chief M. Co. has incorporated at Spokane, capital \$375,000. H. A. Fosselman, J. W. Phillips, W. D. Vincent, John Phillips, F. M. Long, John Brown and T. J. Shea are the trustees.

The Ophir G. & C. M. Co. has incorporated in Spokane, capital \$100,000. T. B. Garrison, W. Y. Clark, Thomas Hird, M. A. Mitchell and D. P. Bagnell are the trustees.

The Western Development Co. was incorporated at Spokane, capital \$2,500,000. R. W. Kennedy, Frank Walton, L. G. Hays, J. W. Hays, D. W. Henley, A. M. Premo and A. G. Kellam are the trustees.

The Daines M. & M. Co. has been incorporated; capital, \$100,000. The trustees are G. W. Daines, W. R. Eisenhour, M. A. Dehuff, W. H. Jackson and A. Stern, all of Spokane.

P. Clark's new corporation, the Spokane Development Co., has incorporated; capital, \$1,000,000. Spokane people, with H. Frank of Butte, Mont., will take practically all of the stock. "The company will operate all over the Northwest," so Mr. Clark says. "We have already secured several interests on Prince of Wales island, Alaska, and we shall do a good deal of work there. We have also taken hold of a big free-milling proposition near Cape Nome. It will be purely a development company."

STEVENS COUNTY.

(Special Correspondence).—The Great Republic mine, C. C. Knuston manager, situated 8 miles from Northport, has installed a steam hoist in its tunnel, preparatory to sinking a shaft on the first of three veins opened by the tunnel. The ore is auriferous pyrrhotite and chalcopryite in a quartz vein in diorite.

Northport, July 11. H. S. R.

Manager M. C. Cooper of the Union G. M. Co. says his company has given a bond at \$65,000 on the Montana to W. H. Brown, representing a Toronto syndicate.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The Granby Smelter, at Grand Forks, is operating two furnaces and has ordered two more, which will increase the capacity of the plant to about 1200 tons per day. It is also given out that copper converters are to be put in, to reduce the copper matte to bullion. The ores which keep the plant running come mainly from the mines of the Boundary district; they consist of a copper and iron sulphide, whose values are gold, silver and copper. It is claimed they have smelted 175,000 tons of ore within the last eighteen months. It seems probable that a branch of the Great Northern will be built from Grand Forks to Republic, Wash., to afford ore transportation from Republic to the Grand Forks Smelter. It is believed the highly siliceous ores of Republic camp may be mixed with the sulphides of the Boundary district and successfully smelted. This railroad proposition contemplates the building of a line from Marcus, on the Spokane-Rossland line, up the Kettle river via Grand Forks to Republic, thence westward to Midway, and then to a point on the Okanogan river, where connection will be made with boats to the Columbia.

The cyanide mills erected at Republic

do not appear to have operated satisfactorily thus far. The ores, in which the gold values are the more important, carry good values in silver, and the latter could not be saved to a satisfactory per cent. Then the ores carry no iron or lead base, but run about 80% silica; they are not suited to concentration, because the material is of a uniform specific gravity; hence the new railroad line that will give the Republic ores an outlet to the smelters is at present of vital interest to the district. It is claimed, optimistically, that the district mines could ship 700 to 1000 tons of ore to the smelter daily.

Grand Forks, July 13. WASCOTT.

The Eva mine on Fish river, Lardeau district, has been sold by the Imperial Development Syndicate, Ltd., A. H. Gracy manager, to the London & British Columbia Gold Fields. There are a number of free milling gold ledges on this property.

A. F. Rosenberger of Nelson has bonded the Oyster group on Lexington mountain, adjoining the Eva mine. Development work will be started at once.

At the Silver Hill mine, in Ainsworth mining district, development work is projected to start up soon. A tramway from the mine to the wagon road will be built. The last payment on the bond of the Iron Horse, Ten Mile, Slovan City mining division, has been made, completing the total of \$19,500. The property is being developed. It is said additional machinery will be installed.

Nelson, B. C., July 5.

The annual report of the Minister of Mines shows a material increase in all varieties of mining during 1900. In assembling the output of the lode mines in the tables the established custom of the department has been adhered to, viz., the output of a mine for the year is considered that amount of ore for which the smelter or mill returns have been received during the year. In the table the amount of the shipments has been obtained from the certified returns received from the various mines. In calculating the values of the products the average price for the year in the New York metal market has been used as a basis. For silver, 95% and for lead 90% of such market price has been taken. Treatment and other charges have not been deducted:

Improvements are being made upon the Lenora mining property at Mt. Sicker, Vancouver island. The new two-drill compressor has commenced work on No. 3 tunnel. A winze has been sunk from No. 2 tunnel, which will connect with No. 3 tunnel, and through which all the ore from both will be taken out. A three-compartment shaft is also being started. The mine is shipping sixty tons of ore daily.

The St. Eugene Co. are planning a new arrangement for handling their ore. J. Cronin, the manager, says: "We are now sending our ore to Antwerp and to Hamburg, but freight and treatment rates on it are about \$31 a ton. Shipping 100 tons daily, the monthly freight and treatment bill is \$90,000. We are negotiating with other European smelters to handle our ore, and hope to make satisfactory arrangements, otherwise the mine will stop shipments."

A Vancouver syndicate, J. F. Howe manager, is developing a gold property on the Seymour narrows, above Comox, on Vancouver island. The ledge through three claims is some 200 feet wide and carries an iron capping. Assays from the

surface of the capping gave values of \$5 in gold and copper. At a depth of 30 feet the shaft was well through the capping and the copper and gold values increased until they reached about \$13 to the ton. A crosscut on the ledge has been run in for 75 feet, and the values in the bottom of the shaft are well maintained. A dispute has arisen between the syndicate and the Esquimalt & Nanaimo Railway Co., the latter claiming the mine on the ground that it is an iron mine, and that under the terms of its grant it is entitled to all its base metals.

The preliminary surveys for the compressor plant of the Payne M. Co. have been made. Supt. Garde states that if sufficient water power can be developed on the site chosen a 12-drill compressor will be built immediately. Regarding the proposed concentrator, tests are being made of the dumps and the waste in the mine, and if these tests justify the construction of a mill it will be commenced. No extensive operations will be undertaken until the air compressor is finished, so that cheap power can be furnished.

The directors of the Ymir mines announce that the experimental cyanide plant is a success, and that a large plant will be installed immediately. It is also probable that the number of stamps will be doubled and the cyaniding plant will probably be built to treat about 400 tons daily. The saving of the cyanide plant is about \$1 per ton, equivalent to an addition of between \$5000 and \$6000 to the monthly profits with the present ore production.

The Anderson Lake M. & M. Co., near Lillooet, are reported to have cleaned up for May from a twenty days' run eighty-five ounces of gold. During the run in April ninety-eight ounces, value \$1645, was cleaned up.

KLONDIKE.

The reports from Salmon district are said to be encouraging. The district is full of prospectors who are making new and rich finds daily. Considerable development work has been done on many claims and surface indications of value are being verified. There are already hydraulic propositions on which machinery is in operation. Hootalingwa, the starting point for the new diggings, is rapidly growing into a city.

It is stated that the uncompleted stretch of telegraph line from Ashcroft, B. C., to Dawson has been finished and the gap on the Stickeen river closed.

MEXICO.

(Special Correspondence).—At the Alma mine, Carbo, Sonora, three shafts are under way and 1000 tons of ore out on the dumps already. The mine comprises thirty pertenencias (sixty-four acres) in original mine, patented, and 500 acres adjoining, denounced. Through this area runs a large copper-bearing dike, outcropping 60 feet wide for a mile in length, and showing ores carrying gold and silver additional. C. C. Taft and others in Des Moines, Iowa, are incorporating the Alma M. Co., for the purpose of working the mine and erecting smelter or other reduction works. A. Graves is general manager.

Carbo, Sonora, Mexico, July 10.

The Taxco M. & M. Co. has incorporated at Denver, Colo., to operate in the Taxco mining district in the State of Guerrero, and also in the adjoining State of Michoacan. The president of the new company is A. C. Beatty of Denver. Associated with him are W. V. Hodges of Denver and B. S. Revett.

W. B. Gester, manager of the quicksilver mines at Saucillo, Chihuahua, reports that a 12-ton furnace for the treatment of the lower grade ores, of which there is a large quantity on the dump, will be started before August. Two retorts are in operation for the treatment of high-grade ores. Four shafts are now being sunk and the two tunnels have been connected.

The Verde Grande C. Co. has been incorporated at St. Louis, Mo., to work a group of copper, silver and gold properties about 25 miles from Hermosillo. R. P. Serrano, Mexican consul at St. Louis, is president. G. H. Martin of St. Louis secretary. A contract for a smelter has already been let and work will begin on it shortly.

PERU.

A copper and silver mining enterprise is being organized by A. W. McCune and other Salt Lake, Utah, people, associated with Butte and New York financiers, including the Hearst and Tevis estates. A company is said to be organized with \$10,000,000 capital, to buy Peruvian mines that have been producing silver and copper for nearly 300 years. J. MacFarlane, formerly of the Anaconda, and later of the Montana Ore Purchasing Co., who has examined the mines, says there is ore in sight valued in the millions.

Personal.

F. B. TURNER of Butte, Mont., is in Los Angeles, Cal.

E. B. RODGERS of San Francisco, Cal., is in Salt Lake City, Utah.

C. T. LINDER of Columbia, Cal., has returned there from New York.

FRANK MILLER of Pitkin, Colo., is visiting Dawson, Yukon Territory.

F. M. BISHOP of Salt Lake City, Utah, has returned there from Mexico.

FORBES RICKARD of Colorado is in California examining mother lode properties.

J. H. KETLEY has resigned as outside foreman of the Ontario mine, Park City, Utah.

E. P. JENNINGS of Salt Lake City, Utah, is in Michigan examining a copper property.

J. P. HANNA of Cincinnati, O., has recently visited the Gold Hill mine, at Express, Or.

VICTOR M. CLEMENT of Salt Lake City, Utah, is in Parral district, Chihuahua, Mexico.

L. CHAPPELLE, lately of Mexico, is now Supt. of the Mohican M. Co. at Carters, Tuolumne county, Cal.

R. S. ROSE of Marquette, Mich., is examining mining property near Nelson, B. C., for Montreal parties.

P. J. DONOHUE of Salt Lake City, Utah, has returned there from a visit to the Sivirioja mines in Mexico.

F. M. SMITH of Montana is in Salt Lake City, Utah, as assistant manager American S. & R. Co. plants in Utah.

E. H. BARTON, C. E., of Sonora, Cal., is in Randsburg, engaged in engineering works for the Yellow Aster M. Co.

J. E. BEVERIDGE of Salt Lake City, Utah, is in charge of operations on the Snyder property at New Pass, Nev.

MAJ. B. C. KINGSBURY of Spokane, Wash., has returned to that place from a visit to Prince of Wales Island, Alaska.

H. S. TURNER of San Francisco, formerly with the U. S. Geological Survey, is in New Mexico examining copper properties.

WALDEMAR LINDGREN of the U. S. Geological Survey is in Placer county, and later will be in Sierra and Plumas counties, Cal., making further detailed investigations of the Neocene river system of the Sierra Nevada mountains.

Commercial Paragraphs.

THE offices and salesroom of the California Wire Works of San Francisco have been moved to 17 and 19 Fremont street, San Francisco, Cal.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING JULY 9, 1901.

677,925.—BARBED FENCE—C. C. Benson, San Diego, Cal.	
678,157.—DYNAMO—B. Bjarnason, Seattle, Wash.	
677,951.—NECKTIE HOLDER—P. M. Gady, S. F.	
677,961.—RAILWAY CAR—G. W. Douglas, S. F.	
677,962.—TRACK BRAKE—G. W. Douglas, S. F.	
677,961.—TERRA-COTTA WARE—E. G. Durant, Pasadena, Cal.	
678,239.—TRUSS BRIDGE—T. G. Gilliland, Union, Or.	
677,982.—PISTON VALVE—J. T. Heffernan, Seattle, Wash.	
678,297.—LIFE RAFT—J. V. Janin, Seattle, Wash.	
677,992.—BLUESTONING SEED—A. J. Johnson, Arbuckle, Cal.	
678,018.—PROTRACTOR PATTERN—J. M. McFarland, Los Angeles, Cal.	
678,014.—VALVE SEAT—E. H. Merrill, S. E.	
678,025.—VEHICLE WHEEL—G. V. Orton, Monterey, Cal.	
678,197.—BED AWNING—L. Price, Los Angeles, Cal.	
678,198.—CENTRIFUGAL PUMP—J. Richards, S. F.	
678,199.—CENTRIFUGAL PUMP—J. Richards, S. F.	
678,201.—PROTECTING TIMBER—C. Schallberger, Seattle, Wash.	
677,910.—PRINTING PRESS—L. B. Woodruff, San Miguel, Cal.	
678,090.—LOGGING RAILWAYS—N. Young, Eureka, Cal.	

Latest Market Reports.

SAN FRANCISCO, July 18, 1901.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c (1000 fine); San Francisco, 58½c; Mexican dollars, 47½c San Francisco, 46½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c. London: £68 per ton.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £12 2s 6d per ton=2.62 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13½c.

IRON.—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$25; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30½c; less, 31c; bar tin, \$3.35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 per flask of 7½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½c.

PHOSPHORUS.—F. o. b. New York 50¢60c per lb.

ASSAY LITHARGE.—San Francisco, 10c per lb, small lots.

BISMUTH.—New York, \$2.25 per lb.; San Francisco, \$2.50 to \$2.75 per lb.

PLATINUM.—San Francisco, crude, \$22 per oz.; New York, \$22 per Troy oz.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

TUNGSTEN.—New York, \$1.95c; San Francisco, \$1.15c.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50¢60c per lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 9½c per 40s.; 14 oz., 40s., 8½c.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 75c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's bbls., 60c; cs., 65c; No. 1 bbl., 50¢52½c; cs., 55¢57½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½¢33½c per lb.; carloads, 30¢31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66½¢ B, 2c per lb.; soda ash, \$1.90 per 100 lbs.; hyposulphite of soda, 2½¢3c per lb.; blue vitriol, 5½¢6½c per lb.; borax, concentrated, 7½c per lb.; chlorate of potash, 12¢13c; roll sulphur, 6c; alum, \$1.90 to \$2.00; flour sulphur, French, 2½¢24c; California refined, 1½¢2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3¢4c per lb.; Cal. s. soda, bbls., \$1.00, sks., 95c per 100 lbs.; chloride of lime, spot, \$2.50 to \$2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BOILER-LEVELING DEVICE.—No. 677,508. July 2, 1901. P. R. Grisez and J. S. Walsh, Montague, Siskiyou county, Cal. This invention is directed to the leveling of portable boilers and thrashing machines or separators when they stand upon uneven ground. It consists of a screw and connections by which it is adjustably supported from the axle or bolster of the machine; a nut and a saddle within which the nut is turnably supported, the saddles serving to support the boiler or other part to be leveled.

WEIGHING MACHINES.—No. 677,636. July 2, 1901. J. Manes, San Francisco, Cal., assignor to Suspension Beam Scale Co. This invention relates to improvements in balances for weighing liquids, solids, and other bodies. It consists of stirrups upon each side of the balance-beam, by which the device is suspended, weighing or platform stirrups similarly attached, a weighing platform provided with trucks upon which trucks and the like may be rolled and weighed, a liquid measuring tank, and means by which the platform may be raised from its bed, and cleared from the ground.

BICYCLE BRAKE AND SUPPORT.—No. 677,804. July 2, 1901. J. Schulte, Jr., Monterey, Cal., assignor of one-half to H. J. Henneker. This invention relates to an adjustment for bicycles, which serves the double purpose of a brake and as a support to retain the bicycle in an upright position when not in use. It consists of a pivoted turnable structure, having a shoe adapted to contact with the ground; a foot piece turnable about the pivot point to depress the shoe; a catch or latch mechanism to hold it after the shoe has been brought into contact with the ground, and a releasing device and returning spring to throw the parts into their normal position when the brake is not in use.

APPLIANCES FOR LOGGING RAILWAYS.—No. 678,000. July 9, 1901. Nelson Young, Eureka, Cal. This invention relates to an improved device for use in logging camps, to prevent the twisting of the heavy cables by which the logs are drawn through the woods. It consists in combination with a road bed and a surface-traveling traction cable, of a triangular plate secured at one apex to the cable, the base of said plate being adapted to rest upon the ground at right angles to the line of travel. There are means central of this base whereby a sled may be attached, and guides disposed at the inner sides of the curves in the road-bed whereby the center of the base of the plate is made always to travel central of the road-bed.

VEHICLE WHEELS.—No. 678,025. July 9, 1901. G. V. Orton, Monterey, Cal., one-twentieth assigned to David Jacks, same place. This invention relates to improvements in wheel attachments whereby the tire and rim are held together without the use of bolts or similar binding devices, and whereby the spokes may be tightened and the felloes expanded whenever necessary. It

consists essentially of a peripheral channel formed on the inner side of the tire, a peripheral projection upon the rim fitting said channel, a cover key whereby the alignment of the felloes is maintained and by which they are expanded, a seat for the spoke tenons, a jam-nut by means of which the spokes may be tightened, and of other details.

REMOVABLE VALVE SEAT.—No. 678,014. July 9, 1901. E. H. Merrill, San Francisco, Cal. This invention relates to improvements in gates or similar devices for the control of the flow of liquids. It consists in combination with a casting, of a pipe section entering the same and means whereby the pipe section is detachably secured to the casting, a valve, a ring detachably fitted to the end of the pipe section and having a flanged face portion of great diameter than the pipe section, adapted to extend over the edge of the pipe section and form a valve seat and extended bearing, said ring having interior grooves which may be engaged by a tool to detach the ring, and said casting having an opening of sufficient size to admit the pipe section and its ring.

NOTICE.

THE JAMESTOWN MINING AND MILLING COMPANY beg to announce to the public that they are now open for its inspection. Their property consists of three full mining claims in the very heart of the great gold district of Tuolumne County. Among their property is the well known "BADGER" mine, which is adjacent to the famous "ROYAL," for which an offer of \$1,500,000 was recently refused. The ore of the Badger mine is ribbon quartz, having an average of 815 in free gold and carrying about one and one-half per cent of sulphuric acid, assaying from \$250 to \$300 per ton. With improved machinery, the cost of mining and milling will not exceed \$3.25 per ton. Now, in view of the fact that the JAMESTOWN M. & M. CO. realize that, in order to make their mines productive and paying properties, they must equip and prepare the mines for the extraction of ore, they will place 25,000 shares of their treasury stock, which is 100,000 shares, on the market at the very low price of 50 cents per share, which will place the mine on a first-class paying basis, in view of the developments already done on the mine. And they are confident that the last 50,000 shares will have a value of \$2.50 per share. To those contemplating an investment, this is a first-class proposition and one that cannot afford to be overlooked. It will bear the closest investigation. PROSPECTUS and the fullest information can be had at the Company's office, Room 21, No. 40 Montgomery St., San Francisco.

J. W. BYRD, Secretary.

MINERS' AND PROSPECTORS' GUIDE.

REVISED THIRD EDITION.

Published by JAMES IRVING & CO.,
128 N. Main St., Los Angeles, Cal.
Contains U. S. State and Territorial Mining Laws, as well as much useful information for miners and millmen.

Price 25 Cents.

SITUATIONS WANTED.

YOUNG MAN would like position as ASSAYER Recent technical graduate. Good references. Address F. L., care of Mining and Scientific Press.

A first-class machinist, engineer and cyanide man wants situation. Ten years' experience in cyanide plants; three years foreman; three years superintendent. All references. Box 31, this office.

WANTED.—POSITION BY PARTY, 35, WHO desires practical experience as assistant to surveyor or superintendent. Has had experience for mining company as all round office man. Has taken surveying and assaying course. Address C. M., care this office.

WANTED.—Position as Superintendent of mine or mill by a technical graduate. Has had experience for a 20-stamp mill and cyanide plant. Am a good assayer and mine surveyor, also a U. S. Deputy Mineral Surveyor. Address B. M., care Mining and Scientific Press.

WANTED, a position as superintendent of quartz mine. Have had years of experience. Can do any thing about a mine or mill. Know the value of a dollar in labor or material, with common sense to back me. No objections to go to South Africa, Corea or Mexico. Can give references. Address B. M., care this office.

Superintendent of a large silver-lead mine for the last five years wishes to change position. Has worked in Montana, Idaho and Canada for 22 years as a miner, foreman, superintendent and manager. Thoroughly competent assayer and surveyor, competent to handle men. Care B. C. A., Mining and Scientific Press.

Position as Superintendent or Millman

by one experienced in wet and dry crushing, cyaniding, pie amalgamation assaying, and melting of bullion. References furnished. Address H., care Mining and Scientific Press.

PRACTICAL COPPER SMELTERMAN,

experienced with large plants and with all references, and change from present position. Knows the business thoroughly. Will act as Supt. or foreman. Address "Ajax," Mining and Scientific Press.

PRACTICAL SMELTERMAN,

who had experience with sulphide and carbonate copper and lead ore in California and Mexico, competent to design or take charge of smelter, wants responsible position as chemist, furnace boss or superintendent. Address "Metallurgist," care Mining and Scientific Press.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

A. M. DONALDSON & CO.,

ASSAYERS AND WASTE PRODUCT SMELTERS,

Donaldson's Assayers' Slag Hammer {1lb. \$1.10
1lb. 8oz. \$1.25

THE UNDERSIGNED, TRUSTEE IN BANKRUPTCY of Wolff & Zwicker Iron Works, bankrupt, is about to offer for sale the entire plant of that company, consisting of foundry, machine shop, pipe shop, boiler shop, blacksmith shop, and ship tools.

The plant comprises about three acres of land and the buildings thereon, situated in the city of Portland, Oregon, at the east end of the Madison Street bridge on Hawthorne avenue, East Water street, and having a frontage on the Willamette river.

Parties interested are invited to correspond with the trustee; will furnish full particulars, and inspection is invited.

H. G. PLATT,

Trustee in Bankruptcy, Wolff & Zwicker Iron Works, Bankrupt.

BRITISH COLUMBIA MINES.

Mines and prospects in British Columbia and the Northwestern States.

Free-milling Gold properties on very reasonable terms.

Excellent chance for profitable investment in legitimate mining.

Correspondence solicited.
Address **ANDREW F. ROSENBERGER,**
P. O. Box 700, Nelson, British Columbia.

Attention of Mining Men

and others is invited to the
**DEAN-OVIATT ORE ROASTER AND
DESULPHURIZER.**

FOR SALE.**FOR SALE OR FOR LEASE.**

Placer mine, 1/2 of a mile of valuable river bottom on Calaveras river, Calaveras Co., Cal. Machinery complete. New four-room house, stables, etc. For further particulars, apply to P. KOPPEN, No. 323 Front St., San Francisco, Cal.

SPECIAL NOTICE.

Capitalists and wealthy syndicates desirous to purchase large operating gold and copper mines, at owners' bedrock prices, can most likely find what they want by corresponding directly with the undersigned. By doing so, buyer and seller can be brought together without the intervention of useless and undesirable promoters, brokers and middlemen. I have several very desirable properties now for sale. E. J. FRASER, 522-523 Parrott Building, San Francisco, Cal.

BOILERS and ENGINES.

We have the largest stock of second-hand Boilers and Engines of all sizes in the West. All sold under written guarantee.

Send for Catalogue No. 37.

THE S. H. SUPPLY CO.,
22nd and Larimer Sts., DENVER, COLO.

FOR SALE.
ONE COMPLETE PLACER MINING DREDGE
OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Hannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

OLD BUILDINGS
and CRANES of

The Risdon Iron Works,
SAN FRANCISCO, CAL.

FOR SALE, FOR REMOVAL,

Consisting of machine shop, foundry and boiler shop buildings, suitable for these purposes or for warehouse or storage buildings. Proposals received now and up to August 1st.

SECOND-HAND
MACHINERY.

PULLEYS, SHAFTING, BELTING, BOXES, BOILERS, ENGINES, HOISTERS, STAMP MILLS, RAILS, CABLE—all but little used.

THE S. S. MACHINERY CO.,
Sixth and Market Sts., DENVER, COLO.
SEND FOR DESCRIPTIVE CIRCULAR.

Lamp users are interested in securing lamps that consume the least current and still give good average life. COLORADO LAMPS fulfill these conditions and hold up their C. P. It will pay you to use them.

Prices and catalogue upon application.
COLORADO LAMP CO.,
2051 California St., DENVER, COLO.

Boesch Lamp Co.,

Pacific Lamp and Reflector Factory,

585 MISSION STREET, ::::: SAN FRANCISCO.

This cut illustrates our 4 H. P. to 8 H. P. **HOISTING PLANT.**

Larger sizes built to suit the demands of our customers.

It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake. No better device has been designed for this purpose. For prices and further information address the builders.

Sole Manufacturers of

Kendall's Patent
Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at Greatly Reduced Prices. Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

For Prospecting Purposes
or Underground Work,

USING COMPRESSED AIR.

HOIST FOR PROSPECTING.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

“THE DANIEL BEST” 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,
16 TONS EACH,
or a total capacity of train,
48 TONS.

CAPACITY
OF
ENGINE,
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

Sole Agents for

The . . . Durkee . Lightning Drill,

which represents the latest improvement in rock drilling machinery. The standard drill does the work of a 2½" air drill and requires one and one quarter horse power. Driven by electric power.

"We find we can accomplish twice as much work at the same expense as by hand drilling. Book our order for the third drill."

"We have been able to double the distance run per month over former work for the same amount of money. We are using only one horse power for the drill."

JOSHUA HENDY MACHINE CO., SAN FRANCISCO, CAL., AGENTS FOR PACIFIC COAST.

Anyone can lay a P & B Roof

Anyone can lay P & B Ready Roofing—it does not require any special knowledge or technical skill. With each roll of P & B Ready Roofing are furnished free sufficient P & B Paint to cement the laps and joints; sufficient P & B Roofing Paint to cover surface and sufficient galvanized iron nails to properly lay roofing contained in roll.

P & B Ready Roofing is made of the right kind of the best materials to make a strong, durable, long-lasting roofing. An economical roofing because it is easy to transport at a low cost—is easy to lay at less cost than any other roofing, and once down, your roofing expense is over. It will stand the hottest kind of hot weather and go through the wettest winter rains without leaking, flaking, cracking, scaling, running or breaking.

Silver,	Fluor Spar,	Metallic Ores

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of June, 1901, an assessment (No. 23) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 225 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ALEX. GRANGER, Secretary.
Office—Room 225 Crocker Building, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of June, 1901, an assessment (No. 3) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801 Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 13th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 801 Claus Spreckels Building, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of June, 1901, an assessment (No. 3) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 801, Claus Spreckels Building, San Francisco, California.

CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1901, an assessment (No. 19) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24 day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
B. N. SHOBECRAFT, Secretary.
Office—113 Crocker Building, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1901, an assessment (No. 31) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 214 Pine street room 31, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24 day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
GEO. W. DIXON, Secretary.
Office—214 Pine street, room 31, San Francisco, California.

THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1 1/2 to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

Prospecting Machinery.

Multitudes in use for testing for minerals. Sizes and equipments to suit any and all conditions. Unexcelled for Placer Testing, Oil Wells, Water Wells, testing for Lead and Zinc, Iron and Coal; goes through anything; brings up everything. Large sizes drill as much as 1500 feet. In use all over the world. Every purchaser pleased. Used on boats for testing river and lake beds. Water no hindrance. No skilled labor required.

KNIGHT'S WATER WHEEL.

The accompanying cut shows the general arrangement of The Knight Water Wheel, direct-coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing. These wheels are designed for 100 to 2500 H. P. Highest efficiency and regulation guaranteed. WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING. Wheels for mill and reversible hoisting works a specialty.

KNIGHT & CO., Sutter Creek, Cal.

For full particulars, send for descriptive catalogue.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.

Our experience of 38 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

State your Head and requirements. Send for pamphlet.

JAMES LEFFEL & CO.
SPRINGFIELD, OHIO, U. S. A.

THE HUG WATER WHEEL

has a guaranteed EFFICIENCY OF 86%, as shown by Test Curves from Cornell University.

Most Economical Wheel on the Market.

No Loose Buckets Possible.

POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.
Send us your inquiries.

CYANIDE 98%

Manufactured by the Roessler & Hasslacher Chemical Co.,
New York, for sale in quantities to suit by

HAAS, BARUCH & CO.,

100 CALIFORNIA ST., SAN FRANCISCO, CAL.

SOLE AGENTS.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General
Arrangement
of
Pelatan-Clerici
Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

Personal; Books Received; Catalogues Received; Recently Declared Mining Dividends; Commercial Paragraphs; New Patents; Notices of Recent Patents; Obituary, 40.

A GRAND JURY at Nome, Alaska, has made a report in which it deals with some of the exceptional conditions under which mining claims are located and operated in the extreme northland. It recommends that Congress amend the mining statutes for Alaska by requiring twenty days actual labor on locations annually and that it shall be done the first year, and under some dates of discovery and location within sixty days after. More specific records of work done are recommended, also some minor details which will tend to prevent duplication and confusion of records. In the main the suggestions are proper. It would seem that they could be simplified, and probably the most effective aid that Congress could give in the matter would be such a local legal organization that the desired changes could be made rules for particular districts rather than general laws for all Alaska mining. People in Nome can hardly be expected to realize that southeastern Alaska has a much more moderate climate than Nome and mining conditions fairly are if anything much less severe than in some of the Rocky mountain country. The general mining laws of the United States can apply in southeastern Alaska without developing such abuses as are possible at Nome.

THE miners of Stockton, Utah, are considering a proposition to unite and jointly construct a tramway line and feeders from the several mines of that district to the main line of railroad. The idea is to make an economy in the present cost of team transportation. The feature that this paper regards as most important is the ownership of the tramway by the ownership of the mines. It is thus kept in its proper subordinate relation to the mining, and all the economy secured goes to the credit of profit of mining. Such operations are naturally part of mining feeders to its profits, and should not be permitted to become feeders off of its profits. Another proposition also under consideration by the mine owners of Stockton has in it the undesirable element of risk that the tramway proposition avoids. Outside capital is proposing to construct a drain tunnel permitting the mine owners to invest in the stock, presumably to a minority interest only. This involves the element of weakness, the necessity of an earning on stock as an investment in distinction from a cost charge for drainage. Either the drain tunnel is justified commercially or it is not. If it is it should be undertaken wholly at the cost of the mine owners as is any other detail of a single mine. If it is not justified it should not be constructed at all. The cost of the tunnel ultimately will have to be paid by

the production of the mines. There is no good business reason why its cost should not be written off against the production of the mines during the period of construction.

THE relation of the consolidated smelting interest to the mine owners as time develops the effect of the business policy of the former remains a matter of serious present consideration. It is clearly to be seen that very considerable economies have been effected in the business of ore reduction by smelting by the application of very simple means. Long-period contracts insuring ore supply and the ability to move the several varieties of ore to the particular plant needing them at the time have made it unnecessary to maintain enormous stock piles, locking up capital. In the aggregate several millions of capital of the smelting combination have been released and have become available for profit earning. The wicked Missouri lead miners who would unload all their cheaply produced lead at the high market rates maintained by the smelter combination, according to the statement of one of the high officials of the combination, have had the lion's hide removed and now appear to be side partners of the combination. The leading people in the combination are discovered to own a number of mines which take up or let out the slack in the general production. The miners who have high-grade ores are finding that they pay higher charges than formerly for smelting and refining, still they make something and are too busy in the present to feel much concern about the future. Low-grade ore mining in quantity is being stimulated by lower charges, made possible by the increased cost charges made against high-grade ore. So far as this low-grade production is gold it does not matter. So far as it is silver, lead or copper, it is a serious question if in extending production by reason of the bonus it gets from the high-grade ore production it is not tending to lower sale prices, which will ultimately react on the whole mining industry. It can not be seen how it will affect the profits of smelting, however, even if it does reduce the market value of mines both high grade and low grade. Another effect that is appreciable is that the business condition created has put the outside small smelter at a considerable disadvantage. The custom mills are similarly effected. The pressure is light as yet, but it is certain to increase. No one of these adverse to profit-earning conditions is by itself very considerable or very conclusive, but the aggregate of pressure they develop is considerable and the method is destructive. The value of mines is fixed not by the gross metal yield, but by the net after all cost charges are met. Clearly, the value of the mine will diminish as cost charges of ore treatment increase. Here, then, is the end to which the smelter combination tends. It will take business advantage of the reduced mine values to absorb the more desirable ones. There is nothing novel about the end. The old Comstock, Nevada, mining and milling by separate corporations were based on the same commercial idea, and the result of their operations was in a smaller way, in a smaller field of activity, precisely the end the present operation will produce, provided that mine owners generally in the meantime fail to protect their property interests by owning and operating their own reduction works.

THE Transmississippi Congress, in its late session at Cripple Creek, Colo., took an initiative to be commended and imitated. It passed a resolution recommending that its own organization and the organizations of the Irrigation Congress and International Mining Congress combine and in one organization, with a longer session, cover more thoroughly the ground divided between them. The spirit of the proposition is correct. Many of the objective points for which the organizations were formed yet remain unaccomplished. In proportion to intentions and magnitude of effort made, results have so far not been much from any of the conventions. The intentions and efforts have largely, but not exclusively, ended with resolutions. The local advertising and exploitation features, and civic rivalry in entertainments offered members, have tended to minimize the serious, practical objects of the separate organizations. These, in a measure, will be minimized by a combination of organizations and one Congress session for a longer period, but the possible springing

up of other needs to take their places must be guarded against. The disposition to magnify local issues by trades and combination among delegates must be restrained. The late convention very properly resolved that there should be a Secretary of Mines, despite the well-meant opposition illumination of a gentleman who protested that the States made mining laws so there was no use for the office. No one appears to have called attention to it, but the gentleman's protest of fact was really one of the weighty reasons why a National Department of Mines and a Secretary should be created. The State laws are one of the petty troubles of the mining industry. The national laws should be sufficient and their administration should be so intelligent as to do away with State laws altogether.

A PROJECT is on foot to consolidate all the producing oil companies in the San Joaquin valley, California, into one company, the object sought being to maintain the price at a profit-earning point. The general features of industrial combinations are to be followed. The new absorbing company is to issue its stock in exchange for the stocks of the existing companies, probably at valuations made by each company in its own interest. The promoters will presumably pay themselves by a stock commission additional which does not represent property. The result will be an inflation of nominal capitalization, already believed to be excessive in its relation to the real investment. The first effect of the organization on the industry will be the raising of the sale return of oil. But in raising this sale price it but adds an additional premium for producing wells outside the combination and a stimulus to the development of new wells. Not only is the sale price of oil raised for these outside wells, which have no excess load of capitalization to carry, but the organization itself must buy these outside wells to protect itself. It can not do this indefinitely with stock issues. The fact of the matter is that the economic idea on which this proposed organization is based is a false one. It is simply a postponement of the payment for the industrial evil it proposes to cure. This paper has pointed out the true economic line of action. The producers of oil should organize to increase consumption and to own the established business of consumption. This line of action, however, requires money. The mere exchange of paper certificates will not accomplish anything in it. Of necessity there can be no great stock allotments for promotion.

THE Canadian Pacific railway is reported as considering the substitution of electric power, developed from water powers, for steam for the portion of its line over the Rocky mountains. The commercial idea is the utilization of natural power now wasting itself uselessly and substituting it for a costly fuel consumption. Two conditions are making the scheme possible: first, the improvements in electrical power traction and transmission, and second, the lowering of the interest rate which makes the fixed charge on capital invested in water-power plants and the current cost of their maintenance less than current payments for fuel and its current charge for transportation till converted into power. In the United States there are mountain divisions of railroads where the substitution can be made. In California the crossing of the Siskiyou mountains on the California and Oregon division has the main Sacramento river, the Shasta river and the Klamath river as sources of water power that can be economically utilized; and the crossing of the Sierra Nevada mountains in Placer county by the Central Pacific overland railroad has paralleling it in the mountains the South Yuba and North Fork of the American rivers and the Truckee river.

THE Mining Congress, in session at Boise at the date of this writing, have adopted two resolutions that will meet with the cordial approval of all miners. The first is "that the magnitude and importance of the mining industry, which has now reached over \$1,000,000,000 of annual product, call for the establishment of a national department of mining, the chief of which should be a member of the President's Cabinet," and the second "that the Congress of the United States be respectfully requested to provide by law for the locating and working of mines of the reserved minerals—gold, silver and quicksilver—on Spanish and Mexican land grants."

Concentrates.

THE occurrence of platinum with a copper nickel ore at Bunkerville, Lincoln county, Nev., is reliably reported.

IN using forms for concrete work, a coating of soft soap prevents the concrete from sticking to the forms when they are removed.

IN the wet process of copper reduction the precipitation of cement copper from the sulphate in the solution consumes about 3740 pounds of iron to the ton of copper produced.

THE failure to record a notice of location of a mining claim within the time limited by statute does not render the location invalid where there are no intervening rights before the record is in fact made.

THE Secretary of the Interior has made a ruling in a Montana case, holding that a locator of a mining claim after having surveyed it for patent cannot hold it indefinitely without continuing the proceedings initiated and offering to pay for it.

GOLD can be precipitated electrically on a cathode plate from cyanide solutions, but it is not to be considered a commercial method of recovery, the technical restriction making the costs too high compared with other processes of reduction.

SHIPPING ORE from Nevada by an all water route to San Francisco is a commercial success. The mines are in the extreme southern part of Lincoln county, and the route is by the Colorado river to the Gulf of California and thence by sea to San Francisco.

LARGE sheet metal—steel or iron—water pipes are successfully manufactured and used. The largest size at present employed is 6 feet in diameter, but there is no engineering or mechanical objection to larger diameters. It is purely a commercial problem of comparative economy.

THE caliche formation of southern Arizona is not identical with the caliche of Chili, South America. The latter is the commercial source of sodium nitrate, containing sometimes as much as 50% of that salt. In genesis the two deposits are explainable by the same theory of drainage and evaporation.

KLONDIKE miners are preparing to make a legal fight for the recovery from the Canadian Government of the royalty paid on the gold production of 1898, on the ground that the grants from the Government, for which fees were paid, expressly stated that grantees were entitled to "all the gold taken from the claims."

OIL has what may be termed a selective faculty for minerals, attaching itself to some and having no effect at all on others. Generally it attaches itself to bright metallic particles and to sulphides. Some, however, it will not effect. Among the latter are blende and magnetite. There is opportunity for its use commercially in concentration.

THE maximum velocity of the water column in the drive pipe of a hydraulic ram rarely gets over 3.6 feet per second. In certain modifications of the hydraulic ram employed in air compression velocities up to 7.5 feet have been obtained in practice. There is with these higher velocities a positive gain in economy, but no higher rate of efficiency.

TWO CAST IRONS of distinctly different physical properties can exist and yet the chemical composition, as determined by analysis, can be the same. The explanation is the different allotropic forms assumed by the same element. Among the minor ingredients of cast iron carbon has three forms; silicon, sulphur and phosphorus have each two known forms.

THE Surveyor-General has repeatedly ruled that in surveying a mining claim for United States patent there can be no land included in the survey that is exterior to the marked lines of the location, regardless of the courses and measurements stated in the written location notice. The leaving out of survey of any portion of a location except a continuous line of lode is permitted on survey for patent.

WHERE it is necessary to use a wrench on a polished rod or shaft, the surface should be protected by a covering of wood to receive the jaws and bite of the wrench. A block should be split and sawed out with the grain to fit the surface of the metal to be held. Bolting the two halves firmly together furnishes a good place for taking hold with a wrench. There are no marks left on the metal after removing the block.

THE Supreme Court of Washington has decided that one corporation may not own the stock of another corporation nor vote the stock of another corporation in that State. The case arose in connection with the Tacoma smelter. The plant was owned by the Tacoma Smelting & Refining Co. Another corporation was organized, bought the majority of the stock of the corporation owning the plant, and then leased the plant to itself.

CEMENT OR ASPHALT applied to the outside of a wall will make it damp proof, if only surface water is to be protected against. The asphalt should be applied boiling hot. Its color is objectionable, but where covered it does not matter. The walls should be thoroughly dry if asphalt is used for coating, but it is desirable to wet them if cement is to be applied. A damp proof course in a wall can be made from slate, two thicknesses, with

overlapping joints, being used. Hot asphalt and coal tar can be used in the proportion of nine parts of the former to one of the latter. The layer should be $\frac{3}{4}$ inch thick.

IN tunnel or stope sets the collar braces or girts are a part of the set, and should be wedged tight with the cap and posts. It is almost impossible to wedge a set in most cases so as to hold in place and tight against collar braces or girts, without driving wedges from the face. Should the set be wedged so as to hold collar braces or girts in place, no amount of blasting in face can displace timbers without moving the timber in rear of set or breaking collar braces or girts.

THE standard wire rope consists of six outer wire strands and a hemp core. For special purposes the number of strands is decreased or increased. When the wire and strands are twisted in the same direction the rope is known as a "lang lay," when in opposite directions as a "regular lay" rope. The strands consist of seven, twelve or nineteen wires each. The value of a wire rope is measured by the service, which depends on care in the selection of materials and in the application of workmanship in the factory.

IRIDOSMINES present with placer gold are separated from it by melting with sufficient silver to reduce the specific gravity of the molten mass. The heavy infusible grains of iridosmine settle through the molten metal to the bottom of the crucible. The silver and gold can then be poured off, leaving the latter behind. Platinum can be fairly well separated from placer gold by panning carefully. If melted up with the gold, it renders the melting more difficult and the resulting bar of alloy harder to assay correctly.

IT is said to have been determined that the height of a brick stack is affected by the temperature of the escaping gas, the increase, when very hot, from the measurement when cold being 1 inch for every 25 feet of height. This expansion is wholly in the inside of the stack, where it is heated, and not at all on the outside, where it is not reached by the heat of the gases. In construction some provision should be made to take up this expansion, and the stack or chimney should not be built rigidly into building walls, but should stand by itself.

THE Nevada State trial court at Reno has rendered a decision on the law of extralateral rights that is a practical reversal of the one decision of the U. S. Circuit Court on the point, though the cases are not precisely alike. There has been no final adjudication by the Supreme Court of the United States establishing the rule. This last decision of the Nevada State Court held that the owner of the apex of a vein or lode on patented agricultural land had a right to follow the lode on its dip into an adjoining tract of patented agricultural land.

THE U. S. Government, in confirming the titles to what are known as Mexican grants under the Act of March 3, 1891, situated in all the land acquired from Mexico, except California, has undertaken to reserve the minerals exactly as reserved from the grants by the Mexican law. The resolution of the Mining Congress at Boise has reference to the minerals so reserved, for while they are expressly reserved to the Government, Congress has made no provision by law by which they could be appropriated, or title to them, or the right to mine and remove them could be obtained by individuals.

A ROUGH working rule for approximately calculating the horse power of water proposed to be used for power development is to multiply the number of inches of water flow by the height of the proposed fall divided by 400. This will give the power that can be developed on the water wheel shaft where the efficiency of the wheel is 80% or over. Thus for example with 2000 inches (50 second feet or 3000 cubic feet per minute) and a fall of 120 feet, the horse power developed would be $2000 \times (120 \div 400) = 3 = 600$. If it be desired to know the number of inches of water required to produce a stated H. P., the head or fall of water being given the calculation for 2000 H. P. required and 50 feet head would be $2000 \div (50 \div 400 = .125) = 16,000$ inches (400 second feet or 24,000 cubic feet per minute). The rule lends itself to rapid mental calculations.

THERE is no demand for a titanic iron ore. The commercial use of titanium is in alloys with iron, and steel, to which it either imparts certain desirable qualities directly or acts by removing certain undesirable constituents, as for example nitrogen. Experiments have been made indicating possibilities of economic value in alloys with copper and aluminum. The demand for all these uses, actual and prospective, is relatively trifling compared with the easily and cheaply obtained supply. It is a very common mineral in the form of the oxide. It is a not uncommon constituent of iron ores. In reducing the iron ores a small percentage of the titanium remains combined with the iron as an alloy, but most of it passes off with the slag. The fused metal is extremely hard, scratching steel and quartz, and extremely infusible, being much more infusible than chromium, tungsten and molybdenum.

THERE is no land owned by the State of California on which mining locations can be made. The State could not get known mineral lands in its selections, and if it did get them they would not be locatable. There is only one way to get a mine on land belonging to the State of California, and that is to buy the land from the State in conformity with the statutes provided. The State law of 1891, requiring record of assessment work, applies to

mining claims on public lands of the United States. The provision declaring a forfeiture for failure to record is not, however, operative. The State in the first place has no control over the title to public land of the United States in any form whatever. It only acquires the sovereignty when the United States relinquishes it by patent or grant in present. Neither can a forfeiture be declared for a failure to record if in fact the assessment work was done. That is to say, a forfeiture cannot be declared on an ex parte proceeding. The party affected has always his right to his day in court and the right to prove and have confirmed his possession. As a matter of fact, the State law requiring record of work does nothing more than to put parties on notice—and tax the right to mine.

IN building small reservoir walls out of such material as is most convenient, cobble and rock, if used, should be put on the outer slope of the dam, and not on the inside. Earth and clay should be placed on the inner face. Dump carts or scrapers can move material to place. The outside of the dam should preferably be kept highest, so that the material deposit is in wedge-shaped layers, the point being at the ground edge of the inner water face of the dam. Slopes for such dams should be inside 3 or $3\frac{1}{2}$ hor. to 1 vert. and outside $1\frac{1}{2}$ or 2 hor. to 1 vert. The surface of the ground on which the dam is to rest should be broken up first, so that the dam structure shall become incorporated with and there will be no seam for water flow. If a leak develop, it can generally be closed by dumping earth along the inside of the dam. The water leaking into the dam will carry the earth in and seal the opening. The preceding refers to dams not more than 10 or 12 feet high.

THE presence of a pay lead in the bed or old channel gravels of a stream above the bedrock, and clearly separated from a pay lead on the bedrock by a stratum of barren wash, is due to the fact that continuously for a long period of time the stream made the level of the pay lead the base level of its erosion and at no time subsequent cut below it. It will be noted that the gold in such upper levels is much more evenly sized, more regularly distributed and in much smaller grains and scales than the gold of the bedrock pay lead beneath. This is a necessary consequence of the relative age in the erosion history of the channel, dating from the time of derivation of the gold from its rock matrix in place. The gold of the upper lead is much the younger, so considered, and is farther, in all probability, from its lode source. The curious phenomena of an upper lead above the bedrock, with no bedrock pay lead beneath, is sometimes presented. Under such circumstances, it is desirable to prospect the bedrock itself, particularly if soft and seamy. If gold is not found in it, the bedrock pay lead is one side or the other, and not far removed vertically.

IN digging a ditch the use of a templet form insures correct and well finished work and an economy of labor. The templet is constructed from four pieces of $1'' \times 3''$ or $1'' \times 4''$ batten stuff. The bottom piece is made the exact length on the lower edge of the bottom width of the proposed ditch. The top piece is made the length on its bottom edge of the top width of the ditch plus the distance of the beginning of the cut from the line of the survey grade pegs. These two pieces are placed parallel and apart, the distance between bottom edges equal to the depth of the ditch cut below the grade peg line. The two sides are then firmly nailed in place on the proposed angle of slope completing the frame, the extra length of the top piece being at one side. A plumb line is then fastened to the top piece and hanging free with the top set horizontal, the point the plumb bob touches on the bottom piece is marked with a nail. Using the templet the end of the extended top piece is made to rest on the grade peg, the frame entering the ditch excavation which is not finished until the plumb bob hangs over the nail. The floor of the ditch must then be uniformly deep enough and level and the banks of the cut must have the proper slope. Care is of necessity taken that no unnecessary excavation shall be done outside of the limits of the designed dimensions.

THE essential element of assessment work through which it effects its object, the protection of the claim from forfeiture, is the actual performance of the \$100 value of labor and improvements on or for the claim by or under authority of the owner of the claim. Who gets the benefit of the work when it is done depends on the circumstances, but some one gets it and the claim does not become forfeit. If the owner does the work himself, or pays the men who do it, he gets the benefit. If a bondee or leaser does the work, it is for the owner's benefit. If the bondee does not pay for the work after it is done, the owner gets the benefit of it. But if the workman has a lien for his work, he may by due legal process dispossess the owner and acquire ownership himself. The owner of a claim can protect his title from becoming liable for payment for the work done under a bond by posting a notice on the claim, in a public place, declaring that he will not be responsible, nor will the claim be responsible, for payment of work done under lease. Verbal notice to the parties doing the work, if given before any work unpaid for has been done, has the same legal effect, but the written notice is preferable. In the State of California the recording of the bond with the proper covenant as to who should pay for work done under it is legal notice to workmen that the owner of the claim is not responsible for payment for work done under it. A part owner can protect his separate interest by a notice.

Sapphire Mining, Yogo, Montana.

Written for the MINING AND SCIENTIFIC PRESS.

The sapphire mines of the Yogo mining district, Fergus county, Montana, are recognized as being among the most valuable gem mines of the world. The great dike in which these gems are found is itself an interesting study for the geologist. Beginning at the western extremity of the known vein, $1\frac{1}{2}$ miles west of Yogo creek, in bodies of massive grey limestone, the dike extends almost due east for a length of more than 5 miles. The vein is remarkably regular, both in size and in yield of gems.

The eastern, or lower, end of the lode is exposed in a small basin on the eastern slope of the Little Belt range, about 10 miles west of the town of Utica and 2 miles north of the Judith river. Here the New Mine Sapphire Syndicate have their lower workings, and from this point to the top of Yogo hill, 3 miles distant, can be noted the great cuts, shafts and other workings that expose the dike. From the top of Yogo hill, and continuing west across Yogo creek, the American Gem M. Co., P. J. Sweeney superintendent, owns the vein for $1\frac{1}{2}$ miles, and for the greater part of that distance it has been exposed by cuts, shafts and drifts.

The New Mine Sapphire Syndicate, C. H. Walker manager, is operating the properties first discovered on the vein. The greater part of the workings of the New Mine Syndicate are surface openings and much of it has been done by ground sluicing and hydraulicking. The water supply is brought to the

Tunnel Entrance on Sapphire Lead, Yogo, Montana.

Hydraulic Mining for Sapphires, Yogo, Montana.

mine from Yogo creek through a ditch and flume 10 miles in length, and a system of sluicing works extends over the entire length of their present workings, and is paralleled by a pipe line for hydraulicking. The oldest workings were begun in 1896, and are about 1 mile east of the summit of Yogo hill. Here there are several great open cuts on the vein, one of which is 700 feet in length and has an extreme depth of 90 feet. Just east of this cut is the Blue Diamond cut, having a length of 1200 feet and varying in depth from 20 to 50 feet, with a width of from 8 to 20 feet. In addition to these are several other large cuts, and a tunnel in one place has been driven 600 feet, having a depth at the face of at least 200 feet. The vein at the surface, and sometimes to a depth of 50 feet, is much decomposed and hydraulicking is sufficient to work it for that depth, but in the tunnel the vein rock is hard and requires powder to break it.

The body of the dike is a basic igneous flow, somewhat brecciated near the surface and having much the appearance of the micaceous schists common to several mountain ranges of this region. Near the surface the rock has many colors, with red, yellow and brown predominating. With depth these give way to a light blue and green or a dark grey, with the latter color predominating. A very fine section of the vein is seen in the face of the Blue Diamond cut, which is about 35 feet high and shows all the gradations of the vein stuff from the surface to the depth where the hard rock is encountered. In the most easterly workings the lode has been opened at a point very little above the level of the Judith river valley. Here it appears in a new formation, as the walls exposed in the cut are of a soft, shaley material, much different from the hard limestone higher

up the hill. The rock of the lode is also different, the entire body strongly resembling the ordinary basalt, but the value in gems is equally as great here as elsewhere.

On the American Gem M. Co.'s property the vein matter is all broken out by powder. These mines have been bonded at \$50,000, although the company has been in active operation but ten months. Several hundred feet of development work has been done. Near Yogo creek, on the east side, a great lime cliff rises abruptly from the valley to a height of 400 feet, and in the face of the cliff can be seen the walls marking the width of the vein where it has eroded between the harder formations composing the walls. Into this cliff a tunnel has been driven from the valley bottom at a depth of nearly 400 feet, and the vein is strong and well defined at this depth.

The method of extracting the sapphires from the rock matrix is much similar to that used by placer miners in sluicing for gold. Sluice boxes are fitted with Hungarian riffles, as in placer mining, but it is necessary to exercise more care in setting them, as the specific gravity of the sapphire is much less than that of gold, and with boxes set at too great a pitch they would pass over the riffles and be lost. When first extracted the vein stuff is passed over a grizzly (screen) and the finer parts pass at once into the sluice boxes. The coarser, harder material is thrown into a dump, where it weathers and disintegrates, and is then washed through sluices. The process of disintegration occupies from one month to a year, according to the hardness and tenacity of the rock. Superintendent Sweeney of the American Gem Co.

Open Cut on Sapphire Lead, Yogo, Montana.

assists the disintegration of his dumps by turning a flow of water on them occasionally, and by this means the hardest of the vein matter is ready to pass through the sluices in two months. For cleaning up the ordinary rocker is used, with three screens of as many sizes, through which the pay dirt is passed. When the pay dirt has been worked down as closely as possible with the rocker it is panned in one of the finer screens, dried and the stones picked by hand from the small amount of gravel remaining. All the stones are saved, the larger perfect ones being valuable as gems, the smaller ones being used as watch jewels and in other fine mechanical work. The imperfect ones are ground and mixed with diamond dust and used in gem cutting and polishing. The stones of the Yogo vein vary in size from sand grain size to four or five karats weight, and as gems they equal in value the best products of the mines of Ceylon and Burmah.

The largest stone yet found in the American Gem Co.'s mines was taken from the Fourth of July claim and weighed eight karats, and one taken from the New Mine Syndicate mines weighed a little more than nine karats. The stones are very equally distributed throughout the vein, but are less broken and somewhat better formed in the deeper workings, although some of the most valuable stones yet found were from the surface. The sapphire color is blue and the shade known as corn flower blue is the most highly prized. Occasionally stones very nearly approaching the ruby are found in the vein, but they are usually imperfect and worthless as gems. The gems produced in the New Mine Syndicate mines are sent to lapidaries in New York and London for cutting, while those from the American Gem Co.'s mines are cut by lapidaries in Helena.

The illustrations on page 34 will give a very intelligible idea of these unique gem deposits and the simplicity of the methods of exploitation required to obtain the gems. There is a difference of detail rather than essentials in comparing the methods of exploitation with diamond mining as followed in South Africa. There, as here, the matrix of the deposit is in an eruptive rock, which weathers and disintegrates, freeing the gems on exposure to the air. The diamond-bearing rock requires a somewhat longer time for this air slacking to complete itself, however. The subsequent separation by water and hand picking is quite similar.

Butte, Montana, Ore Treatment Notes.

[STAFF CORRESPONDENCE.]

The ores of Butte district, at present working depths, are very little oxidized and contain no carbonates. The iron carried by them varies a great deal in percentage, but a general average would doubtless be about 16%. The siliceous material runs 55% to 60%. In practice the ores of the district are separated into two classes—first grade, that goes to the smelters direct, and second class, that is concentrated before smelting. The first grade constitutes approximately 15% of the tonnage mined and will average 12% copper. The 85% of the output that is milled will average 4.8% copper. By concentration the 55% or 60% of silica is reduced to 15% or 20%.

The only change in concentrating methods made here within the last two or three years is in the greatly increased number of jigs used, by which a coarse jig product is made that goes direct to the smelting furnaces.

At the Butte & Boston concentrator mine water is largely used for mill work, but first the larger percentage of copper it carries in solution is precipitated by old iron. At this mill the slimes that finally pass from the tables are settled in a slime pond. A considerable amount of these slime settlements is taken up, dried and used to line the copper converters at the smelters. It is the intention to briquette this material when a sufficient amount of it has accumulated. The Butte & Boston Co. handle about 22,000 tons of ore per month, about 18,000 tons of which are concentrated before smelting.

The Missouri River Power Co. of Helena proposes to transmit electric power from their Missouri river plant to Butte, a distance of 100 miles, and furnish power at the mines for hoisting, air compression and mill work. It is announced that they will charge \$50 per horse power per year. It is also stated that within six months the Butte Light & Power Co will be ready with a similar proposition. The latter generate their power at Big Hole river, 30 miles southwest from Butte. It all means a reduction in the tonnage of coal used for steam purposes and a lessening of the cost of operating.

A concentrating table invented by J. H. Michelsen, but in charge of Miller Borglum, is being tried at the M. O. P. concentrating mill. In many respects it resembles a Wilfley and Cammett, but has a motion that is the distinctive feature. Its longitudinal vibration is imparted by an eccentric and a system of toggles, giving the table a quick, intermittent motion that attracts the interest of concentration men.

Butte, Mont., July 13.

Semi-Automatic Turret Lathe.

On the front page is illustrated a new lathe designed for machine castings and forgings, a semi-automatic turret lathe built by the American Turret Lathe Co., Wilmington, Del., and manufactured in sizes ranging from 20-inch swing to 40-inch swing. The latest design in this series is the 20-inch lathe shown in Fig. 1, which, while slightly different in appearance from the larger sizes, has the essential features of the others. In all sizes, small as well as large, the carriage is rotated, indexed, and clamped by power, and has a rapid travel to and from the work in addition to the slower power feed which is thrown in when the tool approaches the work. This feature has made it possible to construct machines much more massive and for machining heavier work than was possible where the turret, necessarily heavy and massive, had to be manipulated entirely through the muscle of the operator.

In Fig. 2 is a view looking down upon the turret of a 24-inch lathe, showing the lathe and part of the feed mechanism for giving the rapid movement of the carriage along the ways of the lathe and for rotating the turret. At the back of the bed (at the right in the illustration) are three pulleys. The middle one is fast on its shaft, the outer and inner ones loose on the shaft and carry open and crossed belts, like the pulley of a planer drive. When one or the other of the belts is shifted onto the tight pulley, by means of a belt shifter operated by a handle at the front of the machine, the shaft is given a rotary motion one way or the other, according to which belt is driving. The shaft in turn drives the large, coarse-pitch feed screw that extends longitudinally between the ways of the lathe, and the nut in which this screw turns is attached to the under side of the carriage. When the carriage is to be moved rapidly along the ways the drive is through this mechanism; but if a slow feed is desired, the lead screw is driven by means of bevel gears and intermediate shaft and spiral gears from a shaft on the front of the bed. This arrangement enables the operator to control the carriage as perfectly as though moved by hand, and more rapidly.

Motion to the turret-turning mechanism is transmitted through the shaft running parallel with the feed screw in Fig. 2, and it is driven by means of spiral gears, in a manner similar to that employed for driving the lead screw. These gears receive their motion through a pinion keyed to the hub of the inner loose pulley and run continuously as long as the belt is on this pulley.

In Fig. 3 is a view of the top of the carriage with the turret removed, and showing the mechanism for turning, indexing and clamping the turret. There are cams, S, directly over a vertical shaft which is driven continuously by the shaft and gearing just referred to and shown in Fig. 2. The shaft turns in the direction of the arrow and the cams can be made to turn with the shaft by a clutch mechanism which can be thrown in by the handle at the front of the carriage (shown at the bottom of the illustration). The upper cam plate carries a roller R, which comes in contact with the sides of the radial slots of the disk at the center of the mechanism and turns the latter, giving the rotary motion to the turret. The mechanism is a modification of the familiar Geneva stop motion. The office of the cams is to operate the indexing slide L and the clamping device which holds the turret securely to its seat when the cutting tools are operating. The order of operations is first to release the turret clamps, then withdraw the indexing slide, rotate the turret, move out the index slide and finally clamp the turret.

The indexing slide L is operated through the bell crank lever pivoted at D. The end of the slide is notched with a V-shaped notch to fit hardened steel index pins inserted in the under side of the turret. The slide L is withdrawn by the cam striping at point I of the lever and is moved to place again by the cam coming in contact with the roll 2 on the opposite arm of the lever. The slide L is cut diagonally into two parts, which are connected, but between which a small amount of motion is possible. The tendency is thus to wedge the slide L tightly between the sides of the groove in which it slides, and so prevent lost motion.

The action of the cam plate upon the lower bell crank lever in the operation of the clamps is similar to the action just outlined. The clamps C C are pivoted at their upper ends, and their lower ends are moved in or out through the action of the bell crank lever on the toggle motion shown. The outer edges or peripheries of the clamps are grooved their whole length with a single V-shaped groove. The lower flange, which forms the lower side of the groove of the clamp, fits under a projecting flange of the carriage, while the upper side or flange of the clamp fits over the corresponding projecting flange on the under side of the turret. When the clamp is moved out, therefore, its upper and lower flanges draw the turret flange and the flange of the carriage tightly together.

The driving gear of the lathe headstock is shown in skeleton form in Fig. 4, and is an interesting study in mechanism. There are six changes of speed for each step of the cone, all under the control of the

levers at the front of the machine (Fig. 1), and any of the speed changes can be made while the machine is in operation. The feature of the mechanism is that only one shaft, besides the spindle, is required to produce the various speed changes. The cone does not drive the spindle directly, the connection between the two always being a geared connection.

The power feed mechanism of these lathes is obtained through an ingenious train of gearing inclosed in a feed box at the headstock end of the machine. Twelve changes of feed can be obtained by the movement of levers which control sliding featherers, causing any one of a number of gears to do the driving.

The capacity of the machines of this character depends largely upon the arrangement of the turret and the method by which the various tools are held. The turret of these lathes is low and of large diameter, and embodies features that adapt it to an unusual number of operations at one setting of the tools. There is no cross slide upon the ways of the lathe, all the tools for that purpose being carried by the one carriage on which the main turret is mounted. Referring to the plan view (Fig. 2), it will be seen that there is a cross slide mounted on the main turret, which turns with the turret and carries a small auxiliary turret capable of holding four tools. This small turret has an independent power cross feed and is designed primarily for facing or for doing other work where a cut is to be taken with a single pointed tool.

The main turret has five vertical faces, two of which are long enough for three large holes in each face for holding tools, and three of which are shorter and contain one hole each for boring and reaming tools. Fixtures or tools can also be bolted directly to any of the turret faces. On top of the two larger sections of the turret are bolted housings carrying tool slides that can be fed in a vertical direction by the hand wheels, as illustrated in Figs. 2, 5 and 6. The varied uses to which an outfit of tools can be put is indicated in Figs. 5 and 6. In Fig. 5 a pulley is held in the chuck of the machine and is being bored. For the second operation the turret is turned two notches, skipping the left-hand set of facing tools shown in Fig. 5, bringing the boring bar that extends toward the front into position for taking the second or finishing cut. Skipping one face of the turret, as was done in passing from the first to the second boring tools, is no objection with this lathe, because the turret is operated by power, and no extra effort is required on the part of the operator. After the second boring tool has passed through the pulley the next face of the turret is skipped, bringing the reamer into position. This reamer is shown in Fig. 6. In all the boring operations, where it is feasible, the end of the boring bar passes through the hole in the casting, and is supported by a bushing inserted in a recess in the center of the chuck. The same practice is followed in turning, especially when a heavy facing cut must be taken. In Fig. 6 the tools are just approaching the position for turning. The facing cutters are advancing to the work to square the end of the hub of the pulley and true up the edge of the rim. A tool carried by the housing or bracket on top of the turret is also advancing to turn off the first pulley face, after which it will square up the flange between the two steps of the pulley. The finishing cut is taken by the set of tools appearing on the central face of the turret in Fig. 6. In this view the bar for supporting the pulley while the two facing cutters operate upon it is clearly visible. One advantage of a tool operated by a vertical slide is that it can be raised over any projection and brought down on the other side where necessary to finish that side.

In Fig. 7 is shown a method used in these works for adapting the chuck to pieces of various shapes. This chuck is a combination universal chuck, with three jaws and a fourth independent jaw. The projecting portions of the jaw are cast iron pieces bolted to the parts that slide in the body of the chuck. These cast iron jaws can be made of any size or shape, and they are milled in a fixture so that they are interchangeable.

Another special arrangement is the roughing out cutter illustrated in Fig. 8. The difficulty in facing large cast iron surfaces with a broad facing tool is in breaking up the scale. After this has been accomplished there is but little trouble in finishing the casting, even where the cut is several inches wide. The tools for this purpose, shown in Fig. 8, consist of a series of Mushet steel tools held by set screws in the slots of the four-armed holder. Where one of the series of tools fails to cut beneath the scale the next one is almost certain to do so, and by the time a point on the casting has made a few turns past all four arms of the cutter there is little likelihood of any of the scale remaining.

The Parke & Lacy Co., 23-25 Fremont street, San Francisco, are the Pacific coast agents for these lathes.

THE town of Davos, in Switzerland, proposes to dispense with fuel of all descriptions and to resort to electricity for all industrial and domestic purposes. The project is to erect an electrical generating plant at the confluence of two large mountain torrents. Swiss electrical engineers have been studying the possibility of the scheme for several months, and now state that they are in a position to undertake the

work. The cost of the first installation, it is estimated, will be \$1,700,000. Already electricity is extensively employed for cooking, heating and lighting in several villas, while one of the largest bakeries in the district is electrically equipped in every respect. [The proposition in this project to be realized by the use of water power is identical with the suggestion of this paper to the producers of petroleum in California.—Ed.]

The Formation of Bonanzas in the Upper Portions of Gold Veins.*

NUMBER IV.—CONCLUDED.

BY T. A. RICKARD.

CALIFORNIA.—In California, especially in that mining region which follows the foothills of the Sierra Nevada and traverses the counties of Amador, Calaveras and Tuolumne, the occurrence of pockets of rich ore, full of native gold, is a notable feature of the superficial parts of the quartz veins. These pockets appear to be confined to the zone between the surface and the water level, and to be dependent upon the results produced by the small cross veins which encounter the main lodes. In 1887 I had the pleasure of extracting, in two hours, a little over 170 ounces of gold, worth about \$3000, from one of these pockets. It was at the Rathgeb mine, near San Andreas, in Calaveras county. The main lode consisted of 5 to 8 feet of massive, "hungry-looking" quartz, the foot wall of which was a beautiful augite-schist and the hanging a hard diabase. The water level was 160 feet below the surface. Down to this point the country was oxidized, the hanging wall exhibiting only slight alteration, while the schist of the foot wall was softened and decomposed almost to a clay. This was traversed by numerous small veins, which appeared to act as "feeders," forming bunches of rich ore where they encountered the main lode. At the 120-foot level, south from the shaft, there were some old workings; the examination of these led to the discovery of a small seam, about one-sixteenth of an inch thick, filled with red clay which carried a good deal of native gold, as was proved by washing it in a pan. An experienced miner was put to work, with instructions to follow this small streak. It varied in thickness, and occasionally opened out into small lenticular cavities, containing a clay in which the gold was distributed like the raisins in a pudding. Each of these pockets yielded several hundred dollars' worth of gold. At length the streak widened to 6 or 8 inches of quartz, lined with clay. The red clay commenced to increase; coarse gold became more frequent, and a big discovery was hourly expected. It was finally made. The vein suddenly became faulted, and at the place of faulting there was a soft, spongy, wiry mass of gold and clay—more gold than clay. The first handful I broke, while yet the stope was thick with powder smoke, contained three ounces of gold. Within the next two hours this pocket gave us \$3000, and during the following week it yielded

Occurrence of a Pocket.

over \$20,000, an amount which was obtained at a total cost of less than \$200. When it had been worked

out, it was easy to observe the conditions which determined its occurrence at this place, as Fig. 2 will explain. The vein, AC, had been faulted about its own width, namely, 10 inches, by a small cross seam, DE, and at this intersection, B, the pocket lay. The gold was spongy and was intermixed with quartz. The clay which penetrated the whole mass was partly red and ochreous, and partly a gray gelatinous material. In the quartz, and associated with the gold, there were acicular black crystals of pitchblende (uraninite) together with uranium ochre. This association of gold with uranium is uncommon.

NEW ZEALAND.—Intersections which coincide with enrichments form a notable characteristic of the Hauraki gold field in the north island of New Zealand. In this district the occurrence of patches of native gold is an important feature of the regular mining operations. When I was there, in 1891, each stamp mill had its "specimen stamp," a single stamp working in a separate mortar, and employed solely for the treatment of specimen ore. These rich patches occur at the places where the "reefs" or lodes cross bands of flinty quartz. The latter are known among the miners as "flinties." They vary in thickness from a few inches to mere threads of chalcedonic quartz. They are barren in themselves, but have a favorable effect on the gold veins. The latter are also intersected by cross veins, producing an enrichment similar to that caused by the "flinties." Fig. 3

Enrichment at Intersection Moanataeri Mine, New Zealand.

is a sketch of one of these intersections, as seen by me in the Moanataeri mine. The lode, AB, consists of a series of small seams of quartz, conforming to the structural lines of the enclosing country, which is hornblende-andesite. The cross vein, CD, is a band of soft, gray, decomposed rock, which also carries a number of small quartz seams, but only near its crossing with the main lode, AB. The line of CD is parallel to a large fault, to be seen elsewhere in the mine workings. The "leaders" or quartz seams in AB are gold bearing, and exhibit marked enrichment at the intersection with CD.

The prevailing formation of this mining district is an andesite, which is traversed by soft bands of decomposition, called "sandstone" by the miners. The latter, when penetrated by quartz seams, are favorable to the finding of ore. The gold occurrence is essentially sporadic and dependent upon local enrichments, such as have been described. The district is surrounded by thermal springs, and is near the well known volcanic region of Tarawera, which was active in 1884. The mine waters are heavily mineralized and very acid, so that the metal screens used in the mills are quickly corroded. Tellurides and selenides of gold have been detected in the ores; but the precious metal is usually found native and in coarse particles, which are frequently coated with native arsenic. The district is one which, I think, if thoroughly examined, would afford many suggestions regarding ore deposition.

CONCLUDING REMARKS.—It is to be hoped that the recent recognition of the agencies which bring about the formation of enrichments by surface waters will not cause too violent a swing in the direction of a sweeping advocacy of the general efficiency of descending solutions to form ore bodies. The study of the problems of ore occurrence has been hindered in the past by such reactions from one extreme view to the opposite. Therefore, in concluding this contribution to the discussion of the results produced by descending surface waters, I would emphasize the wider agency of ascending solutions in forming the ore masses amid which such secondary enrichments are occasionally found. It is agreed that the sulphide ores are primarily deposited from ascending waters; it is also likely that such a result is repeated. A region once subjected to fracturing, which has permitted the subsequent passage of mineral-bearing solutions, is likely, at a later period, to be subjected to a repetition of these activities. The geological history of many mining regions gives clear evidence of a repeated disturbance of structure. This is indicated by the existence of several systems of fractures crossing each other, the later ones dislocating the earlier. It is probable that each period

was marked by mineralization, the character of which may have varied. The banded arrangements of the lodes of certain districts, such as Freiberg, Rico and Butte, suggests this. Enrichment may have been caused by mere addition; the introduction of other metals may have changed the average composition of the ore in the lode so that it is now extremely valuable, whereas before it may have had no economic importance; a silver ingredient may have been added to the gold contents, or the addition of copper may have made a deposit doubly valuable by improving its metallurgical character. I hope the present discussion on ore deposition will prove as inspiring to further investigation as did Posepny's paper of 1883, and that data concerning the possible secondary enrichment of sulphide ores by the repetition of ascending solutions will be sought for. There is nothing like a working theory to sharpen the observation. Theories do not alter facts, but they often lead us to find new ones.

In cordially welcoming the splendid treatise of Prof. Van Hise I need make no reservation. When Posepny made clear the essential character of the upper or "vadose" water circulation, he did us a great service; and when he combated "lateral secretion" he overthrew a very narrow interpretation of ore formation, which was calculated to hinder seriously our progress toward the understanding of these difficult problems. But Posepny was carried so far by his controversy with Sandberger as to overemphasize the sole agency of ascending currents. At that time, in 1893, I demurred to this extreme view and said, "The word circulation is the key to the whole matter." By this I meant that the entire underground water circulation played a part in the formation of ore, and that to swing from one portion of that circulation to another, restricting oneself to the agency of either, would not (so it seemed to me from experience in the mines) solve the problem.

It does not appear to me that Prof. Van Hise has erred by exaggerating any particular view of the subject. His elucidation of the water circulation as a complete system is based on a broad conception of the whole matter. Of course, in indicating the work done by an agency hitherto largely overlooked, he was compelled to place some emphasis on certain neglected features of the descending portion of the water circulation, and thus to give it some prominence in his masterly analysis. This makes the consideration of the question of secondary enrichments by surface waters one of the most valuable parts of his treatise.

Regarding this question of secondary enrichment, it is to be pointed out that all ore deposits are "secondary," the ore as found by the miner being merely the last term of a series of solutions and precipitations through which its substance has passed in a constant shifting due to the underground water circulation. However, the last stage of the journey is the only one of immediate importance to the miner; and the determination of the causes which brought it there is, to him, far the most interesting aspect of the general inquiry. That Mr. Emmons should also have investigated and illuminated the problem is a matter of much pleasure to a great many engaged in mining throughout the West, to whom his geological contributions have always seemed to possess a practical bearing and value unfortunately not always found in scientific descriptions of geological phenomena.

The California Mining Statute of 1891.

TO THE EDITOR:—The editorial in the Chronicle of this date, under the head of "A Muddle in the Mining Laws," is a violent assumption of existing conditions, based upon an erroneous view of the law. There is nothing in the part of the Act of 1891, therein referred to, which can create an "immense (or any) amount of trouble" in the sense indicated by the writer of that article. The purpose of providing for the filing of an affidavit of annual labor or assessment work is to furnish record evidence thereof, and to make the same prima facie evidence of the same. Such affidavit, being inadmissible in evidence, in the absence of such a statutory provision, Judge Hawley well says in *Book vs. Justice Mining Co.* (58 Fed. Rep., 118), while construing a substantially similar Act of the Legislature of Nevada:

The Act does not prevent, and was not intended to prohibit, the owner of a mining claim from making the necessary proof in any other manner, nor does it prohibit the contesting party from contradicting the facts stated in the affidavit. The statute relates not to the effect of doing the work or making the improvements as required by law, but to the method of preserving prima facie evidence of the fact that such requirement has been fulfilled. There is no provision in the statute to the effect that failure to comply with its terms will work a forfeiture, and the statute is not susceptible of any such construction. Forfeiture of a single mining claim cannot be established except upon clear and convincing proof of the failure of the locators or owners of the claim to have the work done or improvements made to the amount required by law.

It necessarily follows that, if the assessment work be done upon a mining claim, the failure to make and record proof of such labor under the Act of 1891 will not work a forfeiture of the claim. Hence there does

*Trans. Am. Inst. M. E., Richmond meeting, February, 1901.

not seem to be any room for the creation of the serious condition sought to be shown in said editorial; nor does any good reason appear why the Act should be repealed, as suggested by that paper. Such action would merely serve to inconvenience and make it more expensive to the mine owner in proving the essential fact of the performance of the annual work upon his claim.
A. H. RICKETTS.
San Francisco, July 22.

Mining and Metallurgical Patents.

Patents Issued July 16, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS

AIR COMPRESSOR.—No. 678,487; E. Hill, South Norwalk, Conn.

A cylinder with a single-acting piston, a cooler, a duct connected with chamber on active side of piston and extending through cooler and a duct connecting chamber on inactive side of piston with cooler duct before it passes through cooler.

AIR COMPRESSOR.—No. 678,839; C. B. Little, Dayton, Ohio.

A compressor cylinder, a head secured thereto projecting into the cylinder and providing chamber adapted to contain valve and into which a valve is movable, an opening in head forming communication between cylinder and chamber, diameter of such opening being essentially smaller than diameter of valve, so that in event of a breakage of valve it will not be permitted to enter cylinder, a valve casing mounted in head, the valve casing and valve forming outer limit of chamber.

PROCESS OF RECOVERING ZINC.—No. 678,816; A. J. Shinn, Philadelphia, Pa.

The process of recovering zinc from solution of any

of its compounds, consisting of electrolytically decomposing solution, collecting zinc thrown out as an amalgam upon a stream of mercury flowing over a metal plate, separating thick or pasty amalgam from surplus mercury and liquid amalgam during operation of process, and returning liquid to be used repeatedly.

ORE SIZER AND CLASSIFIER.—No. 678,551; J. O. Dimmick, Denver, Colo.

In combination with an ore classifier, a skimming disk adapted to float, and comprising a concave bottom, a central exit therein connected to flexible valved conduit, disk being provided with perpendicular rim provided with perforations at intervals in circumference; a table supported by legs over central exit to receive weight or weights whereby depth of submergence of skimmer may be governed.

ORE WASHER AND SEPARATOR.—No. 678,819; C. V. Watkins, Vinegar's Landing, Wash.

The combination with a rectangular supporting frame, having pins on front bar, of hopper, adapted to fit therein and having arms d' attached to its front end, and provided with sockets to receive pins, and inclined braces extending from sides of frame to upper angle of hopper, whereby hopper is held immovable but adapted for convenient detachment.

CRUCIBLE FURNACE.—No. 678,674; O. Michael, Freiburg, Germany.

A crucible chamber, means for heating furnace having a grate, niches in walls of chamber for reception of crucibles to be preheated, having floors on same level as grate and channels leading from outer walls of niches.

ORE CONCENTRATOR.—No. 678,793; L. Look, Los Angeles, Cal.

A table furnished with riffles extending obliquely across table and arranged coaxially in rows lengthwise of riffles, with open spaces between ends of riffles, and being also arranged parallelly in rows ex-

tending obliquely from feed end toward discharge end of table, with spaces between sides of riffles, and means for shaking table diagonally of riffles.

APPARATUS FOR THE RECOVERY OF GOLD FROM CYANIDE SOLUTIONS.—No. 678,526; C. P. Stewart, Oakland, Cal.

A relatively long horizontal trough, means for supplying solution at one end, a partition near receiving end of trough for distributing solution, a retaining partition at discharge end of trough to retain solution in trough to desired height, a body of quicksilver in bottom of trough between partitions, a series of anodes supported above body of quicksilver, in path of flowing solution, and suitable electric connections with anodes and quicksilver.

The Doetsch System of Copper Reduction.

The process of sulphatization of the raw copper ores at the Rio Tinto mine, Spain, has been partially replaced by the Doetsch system, which substitutes for the roasting a chloride reaction, based upon the action of ferric chloride upon the chalcopryrite. At contact of the ferric chloride the sulphides of copper are transformed into chlorides, while the iron pyrite is not attacked. The ferric chloride separates the copper from the combination without dissolving the iron. The solution containing the chloride of copper is then treated by iron, which precipitates the copper cement.

The solution of ferric chloride is obtained by dissolving salt in ferric sulphate; sulphate of soda and ferric chlorides is thus formed.

To apply the Doetsch process, a commencement is made by crushing the ore to less than 1 centimeter (0.39 inch) size, which is then mixed with 2% of salt and ferric sulphate, the whole being then heaped in piles 4 meters (13 feet) high by 15 meters (48 feet) long and 15 meters wide. Horizontal and vertical openings are made for the circulation of air and water. Upon the summit of the pile a platform is constructed, from which water is distributed uniformly throughout the mass. The water filtering through the ore dissolves the salt and sulphate of iron, which react upon each other, thus producing ferric chloride; the solution attacks the sulphides of copper and, dissolving them, is drained into tanks, where copper is precipitated in the form of cement by means of pig iron and old rails. The consumption of iron is about 1100 kilograms (2420 pounds) per one ton of copper. The cement holds from 80% to 85% of copper.

The waters from the cement contain ferrous chloride, and in order that it may be used again, it is essential to regenerate the ferric chloride. For this purpose, the water is raised by means of pumps, lined with hard rubber, and passes into a tower filled with fragments of coke, through which a current of chlorine ascends, which is produced by the action in reverberatory furnaces of chloride of sodium upon sulphate of iron in the presence of excess of oxygen.

The chloride transforms the ferrous chloride into ferric chloride, which is again employed for solution.

The washing operation lasts about two years; at the end of this time there remains but one-half of 1% of copper in the ore. The Doetsch process has the great advantage of suppressing the fumes of sulphurous acid, which formerly denuded the country about Rio Tinto. It diminishes much of the expense of the iron necessary for the cementation and consumes only marine salt and sulphate of iron, both of which are procured easily and cheaply.

According to Mr. Cumenge, the expense of manufacture of copper of cement per ton is as follows:

Dissolving.....	\$16 04
Cementation.....	34 93
Miscellaneous expenses.....	5 40
Total.....	\$56 37

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

NOME.

(Special Correspondence).—All of the dumps in this district which were drifted out during the winter have been washed out and have generally proven very satisfactory to the owners. Owing to the extreme lateness of the season, sluicing has but just begun upon the creeks and gulches and there is some uncertainty as to the production of this short season. It is believed that Ophir creek, in Council City district, will prove richer than Anvil. There are many rich spots in Port Clarence and Koogerack districts, but so little real mining has been done in these districts at this writing, one cannot judge accurately as to their real values. There is the usual stampeding to the Arctic and Fair Haven districts, but up to this time no reliable information has come from those districts. So far this season there have arrived at Nome about 6000 chechakas (new comers) and about 2000 "sour doughs" from Dawson. The chechakas, as a rule, look despondent, and many will return. The weather has been very disagreeable for about a month—rained nearly every day and the sun has appeared but few times in thirty days. Quite the reverse of last year, when we had about six weeks of almost continuous sunshine. There is still some mining on the beach—probably 500 men between Penny and Nome rivers, working mostly the new ruby sand thrown up by the heavy storms and some of them are meeting with very good success. D. H. JACKSON.

Nome, July 12.

Nome Mining district has been divided, the old Bonanza district having been practically re-established with the recording office at Port Safety.

A. Allen, of Spokane, Wash., proposes to mine the Nome beaches with a submarine dredge which, from tests made by him, he believes will prove a success. G. Liebes, of Spokane, Wash., is associated in the enterprise.

FORTY MILE.

W. H. Young, a miner of Forty Mile, says that there will be a great development of properties in that district during the present season, despite the difficulties of getting into it with provisions and outfits. Claims on Montana and Confederate creeks are paying from \$8 to \$10 a day to the pick, and with the number of men at work a large output of gold will be made, even though no greater strikes are made.

JUNEAU.

W. Matlock is doing the development work on sixteen hydraulic claims on Glacier creek discovered last summer.

KETCHIKAN.

To the westward from the Mount Andrews group, on Kasan Peninsula, Prince of Wales Island, is situated the Flemming copper property, now owned by the White Eagle M. Co. The ore is very similar in appearance and value to the Mount Andrews. I. Goldsmith of Kasan is the company's manager.

ARIZONA.

GILA COUNTY.

The Clipper group of copper mines has been bonded by a Richmond, Va., company, represented by W. H. Mercer. There are several hundred feet of development work on the claims, the principal opening being a crosscut tunnel 230 feet long, with a 30-foot winze. H. M. Chance, M. E., of Philadelphia, Pa., is preparing plans for its development, which will be commenced at once.

The Cole & Goodwin copper mines, 16 miles southwest of Globe, have been bonded for a year to a St. Louis company represented by G. P. Andrews, manager of the Pinal Copper Co. Of the price of \$35,000, \$4000 was paid. The claims are developed by 1000 feet of shaft, tunnels and drifts. The ore is chalcopryite, running from 4% to 8% copper.

The cost of copper produced by the original Old Dominion Co., as shown by the books, was: Mining expense, including development work, 1.79 cents; smelting expense, including coke and fluxes, 3.41 cents; general and office expense, 0.51 cent; total cost per pound copper produced, 5.71 cents. The figures cover the average cost for twenty-four months to June, 1895. The records of the old company show that the average ore smelted carried from 10% to 12% copper and that the loss in the slag was from 1½% to 2% copper. The present company smelts ore averaging about 9% copper and the loss in the slag is about the same, that is, from 1½% to 2% copper. The present management, however, is now saving at least 1% copper from the slag, which, with the reduced cost of coke

of over 50%, puts the present company in a position to produce copper for less than 5 cents per pound at the mines.

MARIOPA COUNTY.

The Acme S. & R. Co. are completing plans for a custom smelter at Wickenburg, and expect to be putting machinery into place at an early date.

G. B. Upton, manager of the Oro Grande Co., at Wickenburg, reports the finding of very coarse gold ore in the shaft 215 feet down.

MOHAVE COUNTY.

Grading at the Minnesota mine, near Kingman, for the installation of a 100-ton dry concentrating plant is being done.

PIMA COUNTY.

Anderson & Davis, of Denver, Colo., have bought the Twin Butte mining claims, 30 miles south of Tucson, and it is said that they are planning to build a smelter in Tucson to treat the ores.

CALIFORNIA.

The gold production of California counties for 1900 as compiled by the State Mineralogist is as follows: Amador, \$1,373,788; Butte, \$485,589; Calaveras, \$1,649,126; Del Norte, \$3483; El Dorado, \$368,451; Fresno, \$22,346; Humboldt, \$109,444; Kern, \$805,252; Lassen, \$19,807; Los Angeles, \$5508; Madera, \$104,134; Mariposa, \$157,663; Mono, \$670,200; Nevada, \$1,802,036; Orange, \$2407; Placer, \$986,155; Plumas, \$365,210; Riverside, \$149,292; Sacramento, \$176,007; San Bernardino, \$247,949; San Diego, \$335,937; Shasta, \$733,467; Sierra, \$659,696; Siskiyou, \$951,397; Stanislaus, \$21,212; Trinity, \$571,605; Tulare, \$10,445; Tuolumne, \$1,596,891; Ventura, \$2562; Yuba, \$280,366. There was \$972,185 "unapportioned." The total of gold was \$15,863,355. Twenty counties are not directly credited with gold production.

The copper-producing counties are credited with output as follows: Amador, \$34,100; Calaveras, \$150,585; El Dorado, \$500; Kern, \$750; Madera, \$77,500; Nevada, \$20,472; San Bernardino, \$297,600; Shasta, \$4,166,735.

Of quicksilver Colusa county turned out \$1500, Lake county \$127,345, Napa \$403,500, San Benito \$180,000, San Luis Obispo \$23,886, Santa Clara \$241,073, Sonoma \$99,500, Trinity \$105,982.

AMADOR COUNTY.

It is reported that several rich pockets have been taken out in the Oneida mine on the 1800 level.

The George Upton mine, about 6 miles northeast of Plymouth, is said to be showing up well. The tunnel for 200 feet shows a continuous ore shoot, which will run from \$12 per ton upward.

The Wheeler mine, near Plymouth, has been bought by the owners of the George Upton mine. The mine has a 20-stamp mill. Besides a large gold-bearing porphyry dike, there are two quartz veins on the property.

BUTTE COUNTY.

The County Supervisors' Board of Equalization reduced the assessors' valuation of gold dredging lands from \$175 an acre to \$65 an acre.

The Hazelton mine, formerly the Carlyle, near Forbestown, is to be opened up. T. C. Mayon, the Supt., says the shaft is down 250 feet, with 300 feet of drift at the 200-foot level. There is a 10-stamp mill on the property.

CALAVERAS COUNTY.

The Boire Bros.' mine at Railroad Flat is being developed by C. W. Curtis under a working bond. W. W. Cook is Supt.

The Jones mine, located at Glencoe, has been bought by the Fanny Marie G. M. & M. Co. Brown & Co. of Boston, Mass., have been opening up the property, with F. O. Cortmarsh Supt. The new company has discarded the old works and put in a new hoist and pump.

The Emma mine at Campo Seco, owned by McSorley Bros., has closed down temporarily, having reached a depth that the present machinery can not work to advantage. New machinery is being put in.

Men have been put to work at the Beatrice mine, near Murphys. A new hoist is to be put up.

EL DORADO COUNTY.

Work has been resumed on the Pyramid mine, near Placerville. New machinery and a new mill are to be put up.

The South Sligo mine, near Spanish Dry Diggings, has started up with C. W. Keeney as Supt.

J. M. Nougues, Jr., has started work on the lower tunnel to tap the ledge in the old Josephine mine, at Volcanoville.

Operations have been resumed on the Alpine mine at Georgetown.

NEVADA COUNTY.

J. Clark of Cisco, who has been prospecting and mining at Meadow Lake, believes the rebellious ore of that district will soon be successfully reduced. There

is now at Cisco a 10-stamp mill to be shipped into the district.

The old Locklin mill, near Nevada City, and the Bulldozer mine have been leased to S. B. Weeks and C. J. Bryant, who propose to operate the property.

Supt. H. Morris of the Yuba mine at Mayburt says the ledge has been showing up well. With twenty-five men the 15-stamp mill has been kept running steadily. The water is being pumped out of the shaft.

A party of miners have leased the Gold Blossom mine at Grass Valley from R. Jeffrey and have commenced work on it. The lease is for twenty-one months and is held by J. Northway, H. Green, C. Nettle and J. Rowe.

The financial report of the Truckee River General Electric Co. for the fiscal year ending June 30, 1901, shows total gross receipts of \$69,374.29, of which \$60,455.18 was received from the Comstock, Nev., mining companies for electric power and light furnished the mines. The operating and other expenses amounted to \$16,645.65, leaving net profits of \$52,728.68, out of which six monthly dividends of 10 cents per share, or \$5000 each, aggregating \$30,000, were paid. The cash surplus in the treasury amounts to \$22,728.68. Of the \$100,000 bonus paid by the Comstock mining companies, \$11,741.93 has been rebated, and the present credit balance of that bonus is \$88,258.07. The plant has been in steady and successful operation about nine months.

SHASTA COUNTY.

Supt. Ware says the mill site for the Mt. Shasta mine mill plant has been completed. The mill will be a crushing, concentrating and cyaniding plant of fifty tons capacity.

The Mountain Copper Co. is making alterations on the plant at Keswick, preparing to install converter stands. This addition will affect a considerable economy in freight, as bullion, instead of 50% matte, will be the product shipped. The company is opening up new ground on the opposite side of Iron mountain from the point of present operations.

The building for the converter plant addition at DeLamar is completed and the machinery is being installed. Another engine of 250 H. P. is to be added to the plant. The DeLamar Co. has bought a site on Squaw creek for a pumping station to supply water during two or three months in the year.

The Clipper mine, on Squaw creek, near Kennet, is being reopened. J. H. Walkotte is Supt. The mine will be retimbered and the old tunnel and drifts cleaned out before exploratory work will be resumed.

The South Fork M. Co., at Igo, is driving a 2700-foot tunnel and two shafts, using power drills.

P. Gibney has run a tunnel at Igo on a contract and has developed a good body of copper ore. The proposition is to put up a smelter.

The Trinity Copper Co., which owns the Shasta King, Copper King and other mines, and of which T. W. Lawson of Boston is president, has commenced construction at Kennett, 5 miles from the mines. Manager H. A. Keller states that the 1000-ton smelter is to be located on Backbone creek, 1 mile north of Kennett.

SISKIYOU COUNTY.

E. D. Baker of the Cherry Hill quartz mine, at Cherry creek, has organized a company in New York, capital \$1,000,000, to work the mine on a more extensive scale. It is proposed to run a 1000-foot tunnel.

The new 300-foot tunnel at the Las Parlas mine, on South Fork of Salmon, is completed and has opened up a vein from 14 to 20 feet wide. O. Herschey of Cecilville is Supt.

Howard Bros. have found a rich pocket of quartz above Happy Camp, from which they have taken out \$4000 in gold, with considerable more in sight.

TRINITY COUNTY.

M. McIlwaine of the Lawrence mine, near Carrville, has shipped \$13,000 in gold from a run of eighteen tons of ore, crushed in a little ball mill. The present owners are said to have paid \$5000 for the mine a few months since.

Lorenz Bros. have located 420 acres at the head of Coffee creek and south fork of Salmon river. From prospecting they estimate that the ground will yield \$6000 to the acre and the cost of getting the gold out \$3000 per acre. Water will be obtained from Grizzly creek and brought by flume. A portable sawmill and the sheet iron for pipe will be taken to the mine. The gold on the claim is very coarse, several nuggets worth \$40 each having been found.

TUOLUMNE COUNTY.

Operations are to be resumed on the Contention mine, on Knights creek. G. Howe of Columbia is manager.

The Willietta mine, at Jacksonville, is closed down.

E. Doyle and W. C. Oakes have sold

their interest in the Darrow mine, Jamestown, to the Hampton Bros., who have commenced work. The new owners have put a compressor and machine drills on the mine.

H. J. Sisty, for Colorado people, has made arrangements to reopen the old Soulsby mine at Soulsbyville.

C. L. Linder is manager for a new electric power company who is preparing to put in a power plant on the Tuolumne river near Jacksonville. The ditch will be 16 feet wide, 6 feet deep and 5½ miles long. It will give 120 feet head, from which 2000 H. P. are proposed to be developed. It is planned to begin work by Aug. 15 and complete by March 1 next.

Peterson & Ogden of Columbia have bought out the interest of F. Plummer in the Telephone mine, on Five-mile creek.

D. Kelley has bonded the Admiral Von Tromp mine, Columbia, to a New York company, who have already commenced operating it.

O. H. Perry and S. A. Gilchrist of the Clio mine, Jacksonville, have arranged to have petroleum fuel at the mine, and report that the mill will be started up soon as the fuel is on the ground.

At the Bluebird mine, on the East Lode, near the Buchanan, a prospect quartz mill has just been erected. Fifteen men are employed.

The Hampton Bros. have bought the bond on the Darrow mine at Sonora from W. C. Oakes and E. Doyle, the bond calling for \$16,000 and running for four and one-half years.

The Porto Fino mine, near Carters, owned by J. H. West, is being worked under bond by Eastern parties, who, it is understood, have decided to take the mine.

COLORADO.

BOULDER COUNTY.

The Red Lion mine at Bloomerville has resumed after being closed down for four years. The Red Lion group is one of the largest mines in the Ward district, and has produced large quantities of ore. The present owners are Duncan, Wise & Cheney; D. Hutchinson is Supt. The ore now taken out will be shipped for treatment, but it is expected a mill will be required on the ground for the treatment of the large bodies of low-grade ore.

The Apex M. & M. Co. at Eldora owns a group of seven claims and is repairing the machinery plant to resume operations at once. M. B. Tomblin is Supt.

CLEAR CREEK COUNTY.

J. E. Hunter, D. C. Folsom, T. S. Hunter, J. M. Shoate and W. R. Benzie have incorporated the Folsom-Kelso Mountain Mines Co. in Wyoming—capital \$15,000—to operate mines near Georgetown.

The Terrible mining property, at Georgetown, owned by the New Colorado S. M. Co., Ltd., and the Colorado Deep Level M. Co., Ltd., has been bought at sheriff's sale by R. G. Simonds. The property comprises thirty-five mining claims, millsites, tunnels, etc., and has a record of production of several million dollars.

The Lombard-Polais group at Alice, developed by two tunnels on veins, is reported to have been bought by an English syndicate for \$100,000. The new owners will place machinery on the mine and sink a shaft to connect with the Manhattan tunnel of the Yankee Con. M. & T. Co., which will cut the vein between 700 and 800 feet down. It is planned that when this tunnel is completed a large mill will be built by the Lombard-Polais people at the mouth of the tunnel.

W. P. McCormick has arranged to start up the Blackwood Co. property, near Idaho Springs. It is the intention of Mr. McCormick to put on machinery and sink the shaft.

DOLORES COUNTY.

The Grand Duke, Forest, Magpie, Dawn of Day, Orphan Girl, Wild Cat, Eureka and Cornucopia mining claims, near Rico, have been bought by G. B. O'Reilly for \$8000. It is understood that Mr. O'Reilly will raise a working capital to reopen the properties.

Arrangements are being made to reopen the San Isabel mine at Crestone under a new management. The property is equipped with a mill, air drills, tramway and all necessary machinery.

The Town Topics G. M. Co. of Denver has declared the second quarterly dividend of \$5000, payable on August 1st. S. A. Josephi of Denver is president of the company, which is operating the East Notaway mine, at Central City, under the management of M. D. Draper. They are now cleaning out the main shaft, which is filled with thirty years' accumulated debris.

LAKE COUNTY.

The company operating the Gold Copper smelter is arranging for improvement to its Leadville plant and for the erection of another plant at Robinson. The improvements to be made at Leadville are to con-

sist of a system of ore bins and mechanical arrangements for the automatic handling of ore to the furnaces. It is intended to build the smelter at Robinson this year. The company owns the Robinson and Washington mines at Robinson, which they will operate. W. B. Duvall of Leadville is manager of both plants.

OURAY COUNTY.

The Mountain Lion group, adjacent to the Camp Bird, has been bought by Boston people. D. N. Baker of Newtonville, Mass., is part owner. Mr. Walker, the resident manager, is to immediately put on a machinery equipment.

PITKIN COUNTY.

It is reported that leasers on the Mollie Gibson at Aspen have found rich ore in the sixth level. It is stated that a shipment of seventy sacks of ore going several thousand ounces to the ton has been made. The ore is said to have been found in a large and continuous body and very high grade as far as it has been exploited.

SAN JUAN COUNTY.

Work has been resumed on the Wyandotte group at Silverton by the Mammoth Tunnel Co. Four large leads are covered by a majority of the ten claims of this group. Two tunnels are being run to cut the Wyandotte vein at depths of 300 and 800 feet.

The Syndicate M. Co. has men at work on the Gold Bug group at Silverton. The Syndicate Co. are considering the feasibility of the building of a mill to be operated by water power from the outlet of a lake near by.

The owners of the Zuni group in Zuni gulch, Silverton, have resumed operations. The mine is being put in shape for production and further development. Col. J. Atwell of Pennsylvania and W. C. McKelvey of Cripple Creek now hold the control of the company.

SUMMIT COUNTY.

The Woodbury M. Co., L. S. Cornell of Denver president, has let contracts for extensive development work to be distributed among the sixteen claims composing the group controlled.

The project to establish works for roasting and leaching ores from the Marshall Russell M. Co., on Miller mountain, will add a novel method of treatment for Empire.

TELLER COUNTY.

The Hanna Britt mine has been reopened by lessees represented by J. McElwee of Cripple Creek. The lessees are Kansas City people, who agree to operate for eighteen months, the royalty on ore mined to be 25%.

Cox and partners, leasing the Canary Bird at Cripple Creek, have made a strike on the surface. The ore is not in place, but seems to be in quantity. It is composed of a sand quartz and talc and runs about \$180 to the ton in gold.

U. S. Hollister, L. P. Stauer and M. Smith of Denver have incorporated the Tunnel M. & L. Co. to operate the Finn lease on the Colorado Boss claim, which has been transferred to them by the Cripple Creek Con. Co., and also the Work Co. lease on the Morning Glory No. 4.

IDAHO.

ADA COUNTY.

The Lucky Ridge M. & D. Co., Ltd., has been incorporated, capital \$100,000, by J. R. Monroe, J. H. Longfellow, J. L. Brown, H. M. Elkington and J. T. Pence, who are the directors.

BLAINE COUNTY.

The Idahoan mine, at Hailey, has been bonded, the lessees being required to work on the property uninterruptedly. There is a shaft 900 feet deep on the mine. They intend to begin development about 1000 feet south of this shaft and will run a tunnel to it.

The Gladiator mine, near Galena, has been reopened. The work is in charge of K. Taylor, manager of the Philadelphia & Idaho M. & S. Co.

H. W. Schultz, who is working the Ophir and Trapper claims under a lease from P. P. Baxter of Ketchum and associates, has at least two carloads of high-grade shipping ore out, and has increased his force of miners for the summer.

CUSTER COUNTY.

R. Bell says a body of fine smelting ore has been opened up in the Democrat vein at Bayhorse by lessees. The shoot, he states, carries an average of 100 ounces silver, 55% lead, 5% copper and \$3 gold per ton. This mine is owned by W. Treloar, formerly of Salt Lake City, Utah.

IDAHO COUNTY.

W. H. Harris, superintendent of the Victor placer mine on Salmon river, near Grangeville, says the present company has owned the property for six years, and has during that time developed the mine. The plant has a capacity of about 8000 yards a day and the 210 feet of gravel

bank is said to give an average value of 7 cents a cubic yard.

A. M. Moore of the Wise Boy mine, in Buffalo Hump, states that he and his associate owners will put a stamp mill on the mine at once. The intention is to mill a large body of high-grade ore while development work continues.

MONTANA.

BEAVERHEAD COUNTY.

S. J. Dennis of Butte has bonded the Indian Queen mine and will do development work on it.

DAWSON COUNTY.

D. T. Haskett & Co. are working the tailings from the Hecla plant at Glendive with a concentrator and cyanide plant.

JEFFERSON COUNTY.

Miles & Delmos have an eighteen months' lease and bond on the National claim, 7 miles east of Butte. The property is a gold mine owned by the National G. & C. M. Co. of Butte. The vein is said to be from 10 to 25 feet wide, with ore carrying from \$10 to \$15 in gold per ton. The ore requires cyanide treatment. If the bond is not taken up, the company will build a cyanide plant for treating the ore.

LEWIS AND CLARKE COUNTY.

The Plegan mine, near Marysville, has been bought by the Plegan Con. M. Co., incorporated by O. M. Lanstrum and J. Larson of Marysville and N. B. Holter, J. A. Walsh and C. C. Newman of Helena. The capital is \$250,000.

W. Dunn and H. Huberger, who are sinking the 100-foot shaft on the Calumet, at Copperopolis, the property of Spencer, Mayn & Heitman, E. M. Edwards and A. M. Holter of Helena, has made a big strike.

The D. & C. M. Co., operating the American Eagle mine at Helena, has bought the 10-stamp mill at the Woods & Esler mine near Winston, and will install it at the American Eagle at once.

MADISON COUNTY.

(Special Correspondence).—The Watseca mine and mill is at Rochester, 12 miles southeast from Melrose, on the Oregon Short Line. The mine is opened through two shafts, several hundred feet apart—one a vertical shaft 200 feet deep and the other an incline about the same depth. On some levels of the mine the ores are oxidized, carrying gold that is partially free-milling. On other levels the ore consists of an iron, arsenical and antimonial sulphide, carrying good values in gold and some silver. The company is operating a mill which they have leased. It is equipped with cyanide apparatus, crushers, rolls, grinders, plates and concentrators. The oxidized ores are first cyanided, then passed through Huntington mills, thence over the amalgamating plates. The larger percentage of the gold is saved by cyanide, the object of running the leached material over the plates being to secure the larger particles of gold that fail to dissolve. It will be observed that this cyaniding first and amalgamating the tailings is the reverse of the usual method. The base ores, heavy in iron and sulphur, with some arsenic, antimony and lead, are crushed, rolled, screened and run over Wilfley and Standard concentrators, by which four or five tons are reduced to one ton, making a product that grades high, and which commands at the smelter an allowance for the iron it contains. The Watseca belongs to McCune and associates of Salt Lake City, Utah, the mill being in charge of H. S. Kenney and the mine in charge of Supt. Kingsbury.

Rochester, July 17.

SILVER BOW COUNTY.

(Special Correspondence).—A good deal of new work is being done in the range of hills on the east side of Silver Bow creek, at Butte, the idea being to demonstrate, if possible, that the great ore shoots of the main copper belt extend eastward to that locality. A little time, energy and money will settle the question as to whether the Butte copper district can be enlarged in area.

The Butte Reduction Co. mill receives the second grades from the Clark group, most of which comes from levels at 1000 to 1400 feet. This mill is equipped with crushers, rolls, Chilian grinders, elevators, screens, about forty Wilfley tables and the same number of jigs. Five grades of jig product are made. The jig tailings that fail to pass a 16-mesh screen go to the Chilian grinders. The fine jig tailings and the grinder product pass to the tables. These ores carry considerable amount of iron and from 60% to 70% silica. The slimes, resulting from the ores being ground to a fine pulp, are passed over tables. Much of this slime is sufficiently fine to pass a 200-mesh screen. The slime water from this group of ores carries very little copper in solution. In the crush department a powerful magnet has been set at the head of the crusher and trommels to pick up hammers, drills and

picks, which often come down in the ore, and which otherwise would break the machinery. The magnet will pick up a 6-pound hammer.

Butte, July 12.

E. H. Wilson of Butte has located a claim which he has called the "Blue." It is surrounded by properties said to be rich in mineral.

NEVADA.

LANDER COUNTY.

The New Pass G. M. Co. has incorporated, capital \$250,000, to operate the Superior and eight other mining claims in the Reese River mining district. W. G. Filer is president, G. C. Snyder, of Salt Lake City, Utah, secretary and treasurer.

LINCOLN COUNTY.

R. A. Parker, consulting engineer for the United States M. Co., has returned from Bunkerville, where he has been conducting an examination of property that was acquired by R. D. Evans of Boston and his associates, operating a copper mine at Bunkerville, employing twenty-five men, and says that while a fine body of copper-bearing ore has been encountered, carrying some nickel, the most interesting feature is the presence of platinum. As developments have progressed the amount of this metal has become more pronounced, though the values are not large.

WHITE PINE COUNTY.

Work is to be resumed in the tunnel in the Eberhardt mine, near Ely.

WASHOE COUNTY.

S. Francovich, L. D. Piazza and D. Dondero have taken \$15,000 from a 250-ton run from their mine at Olinghouse.

W. C. Williams has taken \$3700 gold from sixty-three tons of ore from his mine at Olinghouse.

NEW MEXICO.

GRANT COUNTY.

The Pinos Altos M. Co. is retimbering the old Bell & Stephenson workings at Pinos Altos. The mill improvements have been completed and the capacity increased to 200 tons daily.

R. L. Powell and F. J. Buck of Silver City have leased the old Bell & Stephenson dumps from the Pinos Altos G. M. Co. and are preparing to work them by the cyanide process.

The Gem Turquoise & Copper Co. has bought the turquoise and copper claims at Burros, commonly known as the Parker mines. J. M. Wiley is Supt. The company will cut and market their own turquoise, and H. E. Oppenheimer has been appointed as European agent and A. Lorsch & Co. of New York City as agents for the United States and Canada. The president of the company is A. K. Sloan; F. T. Sloan is secretary of the company. A fifty-ton concentrating mill will be erected for the treatment of the copper ores.

SANTA FE COUNTY.

A rich strike is reported to have been made in the Black Hawk mine, near Golden.

SOCORRO COUNTY.

The Maud S. mill at Mogollon has been started up and is intended to be kept running to its capacity of fifty tons daily.

The Last Chance mill at Mogollon is being operated.

OREGON.

BAKER COUNTY.

The Kenyon & Brown placer claim, about 15 miles southwest of Baker City, consists of 290 acres, which they are preparing to work on a large scale. The gold produced averages \$16 per ounce, and is quite coarse. The bedrock is slate, above which is 6 feet of gravel very rich in gold.

W. Smith has struck a rich placer on Snake river, opposite Flick Bar, taking out \$400 in June with his rocker. The gold is coarse, some pieces weighing \$2. Much of the dirt pays \$5 to the wheelbarrow load.

JOSEPHINE COUNTY.

The Horseshoe ledge on Foote's creek is owned by Ward, Wiggins & Silsby of Grant's Pass. The vein carries gold values running \$50 to the ton free milling. A new stamp mill is being put on the mine.

The mine of Fitzgibbon & Son on Foote's creek has been bought by Y. T. Blake of San Francisco, who is arranging for its further development.

The Copper Stain mine in Mt. Reuben district is owned by J. H. Wetherell & Co. of Grant's Pass. The ore has an assay value of \$20 to \$35 per ton, mostly in sulphurets. The rock, besides gold, carries copper and silver.

The Fortune M. Co. has been incorporated, with headquarters at Grant's Pass. The capital is \$50,000. O. S. Goodnow, J. Ward and J. L. Wiggins are the incorporators.

MARION COUNTY.

B. P. Taylor of Pomona, Cal., and sev-

eral Colorado men, have bought the Savage-Mohney mine at Quartzville and are now making arrangements for its development. Mr. Taylor will be Supt.

SOUTH DAKOTA.

PENNINGTON COUNTY.

It is reported that the Father DeSmet stamp mill of the Homestake Co. will be started up. The clean-ups now amount to nearly half a million dollars a month, and with new mill in operation it will add \$50,000 to this. The clean-up at the new cyanide plant is reported to be far above expectations.

It is said that W. O. Morrison and associates of Colorado Springs, Colo., have bought a half interest in the mines of E. Hanschka, in the Ragged Top district, for \$50,000. A large cyanide plant is to be erected.

UTAH.

Arrangements for the enlargement of the mill of the Annie Laurie of Gold mountain have been completed, to cost about \$10,000, and will provide for two additional leaching tanks. This will not, says Manager W. G. Filer, make any great increase in the treatment of ore, but will enable them to keep the ore in the tanks longer and secure thorough leaching.

BOX ELDER COUNTY.

The Mayflower G. M. Co. has been incorporated, capital \$75,000. G. W. E. Dorsey is president and W. W. Brown of Salt Lake City secretary. The company own the Daisy group of seven locations in Park valley. W. E. Dorsey is manager and has started development work on the ground.

GRAND COUNTY.

The Wolf Bros. have opened a good vein on the Skylark at Basin City, carrying both gold and copper.

The Pilot Mountain Co. has been at work on its tunnel and has opened a vein 14 feet wide, which spans gold all the way across.

JUAB COUNTY.

R. J. Evans has bonded the Selma group of four claims, near Homansville, of L. C. Peterson and F. Zamboni at \$30,000. It is understood that Mr. Evans will organize a company to undertake some extensive development work.

TOOELE COUNTY.

The Montana Con. M. Co. has incorporated, capital \$100,000, R. Mulhall president, J. B. Weimer of Salt Lake City secretary and treasurer. The company owns the Challenger and nine other mining claims in the Ophir mining district.

The mine operators of Stockton are organizing to provide cheaper transportation between the mines and railway. I. A. Benton, president of the Cygnet mine, says the proposition is to build a tramway of sufficient capacity to haul the ores from the mines embraced in the undertaking, a spur running to each. The tramway will not be an expensive undertaking, nor require much time to construct. In the reduced cost of transportation the tramway is expected to soon pay for itself.

WASHINGTON.

FERRY COUNTY.

A strike has been reported on the Orient, on the Kettle river, about 12 miles from Marcus. It is owned by a Noblesville, Ind., company. Two shafts have been sunk and a tunnel run in some 500 feet. The company has in operation two drills and an air compressor. W. Townsend is Supt.

SPOKANE COUNTY.

The Diamond G. & C. M. Co. has been incorporated, with its head office at Spokane, by J. E. West, H. R. Miller, T. F. Bailey, G. A. Graham, W. H. Spaulding of St. Regis, Mont., B. R. Lindly and J. R. Cassin.

STEVENS COUNTY.

The Northport S. & R. Co. has been incorporated by W. B. Heyburn, E. M. Heyburn, W. B. Sams, D. C. Corbin and J. W. Morrison at Wallace, Idaho, with \$1,000,000 capital, all subscribed by the directors—W. B. Heyburn, B. F. O'Neill, L. Odell, B. MacDonald and T. M. Daly. Mr. MacDonald, as trustee, subscribed for 999,996 shares and the other directors for one share each. The object of the corporation is to acquire the Northport smelter, the legal status of which had been affected by the decision of the Washington Supreme Court ruling against one corporation owning the stock of another.

FOREIGN.

BRITISH COLUMBIA.

A strike of a 40-foot vein is reported on the Niagara group, owned by D. Mowat and others of Nelson. The ore is low-grade, but free-milling. Surface assays yield \$7.50 a ton.

The diamond drill in the Idaho, owned

by the Dominion Copper Co., at Phoenix, has struck almost pure copper ore at 80 feet down.

The St. Eugene mine, at Moyle, in East Kootenay, has quit breaking ore and is only doing development work. The company had a contract with a Belgian company to ship 9000 tons of ore within six months, to be paid for on the London quotation, which was about \$16 per ton for lead when the contract was made. Since then the price has dropped to about \$12 per ton, and is so low that the company has decided that it would be robbing the mine to keep on shipping beyond the contract.

The Horsely Hydraulic Co., since the hydraulic plant at Horsely was closed down after working 900 feet into the bank, which there became so hard that it would not yield its gold either to hydraulic or powder, has been developed as a drifting proposition. The property takes in an ancient river channel bed that has been explored from one rim a distance across the channel of 1800 feet without striking the opposite rim. The bedrock, so far as known, lies about 90 feet above the bed of the Horsely river. The development work has been the opening up and blocking out of the ground for the extraction of gravel on a large scale. The blocks of pay gravel opened up are thoroughly tested, and several hundred tons have been extracted and crushed in the company's 10-stamp prospecting mill. It is estimated that over 100,000 tons of gravel are now opened up ready for extraction. The gold extracted during the progress of development work has paid a large percentage of the cost of this work. The bottom stratum of gravel from 2 feet to 6 feet yields from \$1.25 to \$6 gold a ton. Platinum to the amount of 1% of the weight of gold is recovered, and it is intended, when the mine is worked, that special appliances will be installed to save it. J. B. Hobson is manager and J. W. Boswell foreman.

A strike is reported from the Ymir mine of an ore body of considerable size and richness. Twenty-six feet of \$40 ore is now said to be exposed on the No. 4 level. Up to the present time large profits have been made from ore in this mine averaging less than \$9 per ton.

MEXICO.

G. Mitchell, Supt. of the Greene Con. mines at La Cananea, says that 1860 men are employed at the mines. The third furnace is nearing completion. It will be blown in about September, increasing the smelting capacity to 700 tons of ore a day. The company has completed 4 miles of its narrow gauge railroad and 9 miles of standard gauge is well under way.

Books Received.

"Field Book of Practical Mineralogy," 12 mo., pp. 186, by G. W. Miller, E. M., C. E., is a handy volume of pocket size, designed to assist the prospector and small mine owner in exploring and exploiting mines, and in making reports on them. Published by Publishers' Press Room Co., 1441 Curtis street, Denver, Colo.

"The Mineral Industry," Vol. IX, 8vo., pp. 936, by Richard P. Rothwell, late editor of the Engineering and Mining Journal, is fully up to the high standard established by its predecessors, not alone in the completeness and accuracy of its statistical data, but in its resume of advances in the arts of mining and metallurgy during the year it records. These volumes have a permanent value for reference that entitles them to a place in the working library of the mine owner and metallurgist. Published by the Scientific Publishing Co., New York and London. \$5 postpaid.

Catalogues Received.

C. O. BARTLETT & Co. have issued Catalogue No. 3, Paint Machinery, an attractive booklet handsomely illustrated, giving descriptions, information and prices of their special types of machines employed in the manufacture of paint and some types employed in grinding and mixing minerals for other industrial use. C. O. Bartlett & Co. will be pleased to mail the catalogue on application for it to their office at Cleveland, Ohio.

JOHN A. ROEBLING'S SONS Co. of Trenton, N. J., have issued a trade catalogue entitled "The Splicing of Wire Ropes." The story of the catalogue, the description of the methods of splicing employed by the company in its factory, for the assistance of the users of wire ropes, is well told in the text and illuminated with many full-page half-tones. It is an excellent book for the mine foreman's library. The John A. Roebling's Sons Co. will be pleased to send it on request made to their main office in Trenton, or to any of their branch offices in New York, Chicago, Cleveland or San Francisco.

Personal.

C. L. LINDER of New York is at Jacksonville, Cal.

W. L. WATTS is examining oil land in Humboldt county, Cal.

W. C. RALSTON has returned from Boston to San Francisco.

MAJ. A. V. BOHN, of Leadville, Colo., was in Salt Lake City on the 19th inst.

W. J. LORING has been appointed Supt. of the Melones mine at Angels Camp, Cal.

M. L. EFFINGER, Supt. of the Tiawau-kee mine at Bingham, Utah, is in Detroit, Mich.

A. J. SCHUMACHER of Butte, Mont., is at Mineral, Idaho, examining copper mines.

L. O. COWAN, superintendent of La Calara mines, Sonora, Mexico, is in Denver, Colo.

H. S. CHANCE, E. M., of Philadelphia, Pa., is at Globe, Ariz., examining copper properties.

CHARLES WOLF has resigned as superintendent of the Gold Hill mine at Angels Camp, Cal.

GEO. H. EVANS of Denver, Colo., is in Sierra county, Cal., examining gold dredging ground.

J. H. MCCHRYSTAL of Eureka, Utah, is examining a mining proposition at Hailey, Idaho.

P. WISEMAN, general manager of the Shannon Copper Co. at Clifton, Ariz., is in Butte, Mont.

R. H. TOLL of Denver, Colo., is now Supt. Sundown and Timberline groups, near Mancos, Colo.

JAMES BURKE, who has been in the East for several weeks, has returned to Salt Lake City, Utah.

O. ABELING of Moscow, Idaho, has gone to Santiago de Cuba to put up a large concentrating mill.

JEAN F. WEBB, of the Pneumatic Cyanide Process, Denver, Colo., recently spent several weeks in Utah.

PATRICK CLARK of Spokane, Wash., is visiting Hollis and Copper Mountain, Prince of Wales Island, Alaska.

MARK B. KERE, Supt. W. Y. O. D. mine at Grass Valley, Cal., has returned from San Francisco to the mine.

O. OBLING, M. E., of Grangeville, Idaho, is at Santiago, Cuba, superintending the erection of a mining plant.

S. W. CHENEY, formerly of the Mammoth mine, Whitehouse, Shasta county, Cal., is now operating in Plumas county, Cal.

J. H. SHOCKLEY, formerly Supt. of the Mt. Diablo mine, Candelaria, Nev., is in charge of the Andrus mine at Telluride, Colo.

GEORGE MITCHELL, superintendent of the Greene Con. mines of La Cananea, Sonora, Mexico, is sojourning at Phoenix, Ariz.

H. J. WALSH, who has spent a year in Sumatra, examining placer mines for a Dutch company, has returned to San Francisco.

EDW. H. BENJAMIN, secretary California State Miners' Association, has returned to San Francisco from Hermosillo, Sonora, Mexico.

C. H. CUTTING, manager of the Troy Copper Co. of Troy, Ariz., has been appointed manager of the Manhattan mine at the same place.

L. CUMMINS, cyanide chemist Headlight mine, Carrville, Trinity county, Cal., has accepted position as chemist for Luckhardt & Co., San Francisco.

ALFRED H. BROOKS and C. C. BRAYTON of the U. S. Geological Survey are examining the mining deposits in Ketchikan district, southeastern Alaska.

The International Mining Congress at Boise, Idaho, elected E. L. Schaffner of Ohio president, Major Fred R. Reed of Boise, Idaho, vice-president, and re-elected Irwin Mahon secretary.

Commercial Paragraphs.

A NEW PROCESS noiseless pinion and cut cast-iron mate have recently been shipped to Glasgow, Scotland, by the New Process Raw Hide Co., Syracuse, N. Y., to be used in connecting an electric motor to a printing press in use at the Glasgow Exhibition.

THE Sierra Railway Co. of California write from San Francisco, Cal., to the Jackson Hand Power Drill Co., Denver, Colo.: "We have been giving your Jackson hand power drill a test and are very much pleased with it. We find that two men with it can do the work of six men by hand."

THE New Process Raw Hide Co., Syracuse, N. Y., is in receipt of an order from an Eastern machine company for ten pairs

of gear wheels, the larger to be cut cast iron and the smaller new process raw hide, making a noiseless combination. The cut cast iron gears run from 20" to 80" and the raw hide pinions from 6 1/2" to 16" in diameter. The total amount of the order is above \$2000.

THE Guggenheim Exploration Co. have let the contract to the Denver office of the Allis-Chalmers Co. for the machinery for their 450-ton concentrating mill, to be erected at their Tecolotes mine, Santa Barbara, State of Chihuahua, Mexico. The Pride of the West Mining & Milling Co. at Patagonia, Ariz., have placed an order with the Allis-Chalmers Co., through their Denver office, for a Holt-hoff-Wetthey roasting furnace, 121x12 feet, with cooling floor, also one tandem compound Reynolds Corliss engine.

Obituary.

WITH regret is chronicled the sad and sudden death of Robert W. Grayson, of the firm of Ralston & Grayson of San Francisco, which occurred on the 20th inst., Mr. Grayson having been found dead in his bed by his father, who, alarmed at his son's non-appearance, went to his room. His death was due to heart disease, and his untimely taking off saddened a circle of friends who held the deceased gentleman in deservedly high esteem. Mr. Grayson was 35 years old, a native of California, and prominent in mining affairs.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING JULY 16, 1901.

678,548.—SPEED REGULATOR—E. N. Corson, Los Angeles, Cal.
678,551.—BROCKETING MACHINE—J. T. Davis, S. F.
678,648.—SAW SET—C. L. Driefer, S. F.
678,562.—DRAWING BOARD—O. Haskell, San Rafael, Cal.
678,618.—FLOW—W. K. Hobson, Santa Maria, Cal.
678,621.—FURNACE—Hynes & Bert, Los Angeles, Cal.
678,639.—CULTIVATOR—T. J. Hubbell, Watsonville, Cal.
678,494.—CAN HEADING MACHINE—W. T. Jones, S. F.
678,793.—CONCENTRATOR—L. Look, Los Angeles, Cal.
678,679.—TREE PROP BRACKET—R. S. McIntyre, Riverside, Cal.
678,798.—TURNING TOOL—F. L. Stearns, Los Angeles, Cal.
678,523.—GOLD SAVING APPARATUS—C. P. Stewart, Oakland, Cal.
678,819.—ORE SEPARATOR—C. V. Watkins, Vinegar's Landing, Wash.
678,803.—SEWING MACHINE—S. B. Wickersham, Phoenix, Ariz.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

NECKTIE HOLDERS—No. 677,951. July 9, 1901. P. M. Cady, San Francisco, Cal., one-half assigned to C. J. Kaighin, same place. This invention relates to an improved collar-button clasp to be secured to a necktie and by which the latter is held in position upon the wearer. It consists essentially of two connected members, each consisting of a plate having a portion bent outwardly and backwardly, and then outwardly and forwardly again, the ends of which are provided with notches adapted to grasp the shank of the collar button and to inclose the head within the jaws so formed by said bent portions.

CAN HEADING MACHINE—No. 678,494. July 16, 1901. W. T. Jones, San Francisco, Cal. One-half assigned to Henry Doyle. The object of this invention is to provide an apparatus for automatically placing the heads of cans in position upon the bodies. It consists of a horizontal endless conveyor upon which the cans are carried throughout the operation, a stop lever which regulates the admission of cans thereon, a revolving spacing and timing guide, a can-head feeder in which the can heads enter, and means by which the flanges of the heads are prevented from overlapping, a revolving carrier by which the heads are taken singly from the feeder and delivered into dies upon a revolving support, and the heads then placed upon the cans and crimped thereon.

CULTIVATOR—No. 678,489. July 16, 1901. T. J. Hubbell, Watsonville, Cal. Assigned to Drusilla Hubbell and Wm. H. Ames of same place. This invention relates to a land cultivator, and consists in a means by which the adjustable tooth-carrying frame may be expanded transversely to cut as wide a space as possible, or contracted to adjust it for travel between rows of trees, plants or vines which may have different spaces between them.

Latest Market Reports.

SAN FRANCISCO, July 25, 1901.

SILVER.—Per oz., Troy: London, 27d (standard ounce, 925 fine); New York, bar silver, 53c (1000 fine); San Francisco, 58c; Mexican dollars, 47c; San Francisco, 46c; New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62 1/2; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: \$67 13s 9d per ton.

LEAD.—New York, \$4.37 1/2; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5c 1000 to 4000 lbs.; pipe 6, sheet 6 1/2, bar 5 1/2; pig, \$5.25. London, \$12 2s 6d per ton=2.62 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, \$16 2s 6d per ton=3.58c cts. per lb.; San Francisco, ton lots, 5 1/2c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$25; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.62 1/2; San Francisco, ton lots, 30c; 1000 lbs., 30c; 500 lbs., 30c; less, 31c; bar tin, \$3 1/2, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, \$9 2s 6d; San Francisco, local, \$48.00 \$3 flask of 7 1/2 lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 \$3 lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5 1/2c; slab, 5 1/2c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15 1/2c.

PHOSPHORUS.—F. o. b. New York 50@60c \$3 lb.

ASSAY LITHARGE.—San Francisco, 10c \$3 lb. small lots.

BISMUTH.—New York, \$3 lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 \$3 lb. lots.

PLATINUM.—San Francisco, crude, \$19 \$3 oz.; New York, \$20.50 per Troy oz.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

TUNGSTEN.—New York, \$3 lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c \$3 lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15c; less than one ton, 17c. No. 1*, 60%, carload lots, 13c; less than one ton, 15c. No. 1** 50%, carload lots, 11c; less than one ton, 13c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9c; less than one ton, 11c. No. 2** 30% carload lots, 8c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 9 1/2c \$3 set; 14 oz., 40s., 8c.

OILS.—Linsed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14c; do., cs., 20c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50@52c; cs., 55@57c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32 1/2@33 1/2c \$3 lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66c \$3 lb.; soda ash, \$1.90 100 lbs.; hyposulphite of soda, 23@23c \$3 lb.; blue vitriol, 5 1/2@6 1/2c \$3 lb.; borax, concentrated, 7@8c \$3 lb.; chloride of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 24@24c; California refined, 1 1/2@2c; nitric acid, in carboys, 8c \$3 lb.; caustic soda, in drums, 3@4c \$3 lb.; Cal. s. soda, bbls., \$1.00; sks, 95c \$3 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

SITUATIONS WANTED.

Experienced and competent cyanide man desires a position as manager of a cyanide plant. Familiar with various methods of cyaniding. Good references. W. B. W., care Mining and Scientific Press.

WANTED, BY EXPERIENCED PLACER AND Hydraulic Miner, position as Superintendent or Foreman. Understands thoroughly hydraulic elevators. Best of reference. Address J, this office.

WANTED. — POSITION BY PARTY, 35, WHO desires practical experience as assistant to surveyor or superintendent. Has had experience for building company as all round office man. Has taken surveying and assaying courses. Address C. M., care this office.

WANTED. — A POSITION AS ASSAYER AND general assistant, if desired. Mexico preferred. Ten years' experience in general mining. Two years managing mines in Mexico. Have practical knowledge of the language. References furnished. Box 32, Mining and Scientific Press.

WANTED. — Position as Superintendent of mine or mill by a technical graduate now in charge of a 20-stamp mill and cyanide plant. Am a good assayer and mine surveyor, also a U. S. Deputy Mineral Surveyor. Address E. M., care Mining and Scientific Press.

MINING ENGINEER, four years in Johns Hopkins' University, thirteen years miscellaneous work in West Virginia, desires work in the West. Address X Y Z, Mining and Scientific Press.

WANTED, a position as superintendent of quartz mine. Have had years of experience. Can do anything about a mine or mill. Know the value of a dollar in labor or material, with common sense to back me. No objections to go to South Africa, Corea or Mexico. Can give references. Address Box 30, this office.

Superintendent of a large silver-lead mine for the last five years wishes to change position. Has worked in Montana, Idaho and Canada for 22 years as miner, foreman, superintendent and manager. Thoroughly competent assayer and surveyor and competent to handle men. Care B. C. A., Mining and Scientific Press.

Position as Superintendent or Millman by one experienced in wet and dry crushing, cyaniding, plate amalgamation, assaying, and melting of bullion. References furnished. Address B, care Mining and Scientific Press.

BLACK SANDS IN GRAVEL.

MINERS working GRAVELS containing BLACK SANDS, and disposed to make fair arrangements for recovery of same, on a large or smaller scale, may benefit themselves by giving me particulars as to location, quantity and facilities for working.

ALMARIN B. PAUL,
27 CROCKER BUILDING, SAN FRANCISCO.

FOR SALE.

Mica Mine for Sale Cheap

on account of death; the best in New England. A. B. PARKER, 18 Greenwich Park, Boston, Mass.

SPECIAL NOTICE.

Capitalists and wealthy syndicates desiring to purchase large operating gold and copper mines, at owners' bedrock prices, can most likely find what they want by corresponding directly with the undersigned. By doing so, buyer and seller can be brought together without the intervention of useless and undesirable promoters, brokers and middlemen. I have several very desirable properties now for sale. E. J. FRASER, 522-523 Parrott Building, San Francisco, Cal.

BLOWERS.

Two No. 10 Sturtevant Blowers; one 6-ft. American Exhaust Fan; two No. 10 Sturtevant Exhausters; one No. 6 Sturtevant Exhaust; twenty-five smaller Blowers and Exhaust Fans.

Send for Catalogue No. 37.

THE S. H. SUPPLY CO.,
22nd and Larimer Sts., DENVER, COLO.

SECOND-HAND MACHINERY.

PULLEYS, SHAFTING, BELTING, BOXES, BOILERS, ENGINES, HOISTERS, STAMP MILLS, RAILS, CABLE—all but little used.

THE S. S. MACHINERY CO.,
Sixth and Market Sts., DENVER, COLO.
SEND FOR DESCRIPTIVE CIRCULAR.

FOR SALE.

The following Second-Hand Material at half the cost of new:

One 70 H. P. Heine Water Tube Boiler.
One 36 in. by 12 ft. Horizontal Boiler.
Two 42 in. by 15 ft. Air Receivers.
150 tons 35 lb. Relaying Rail with plates.
80 tons 40 lb. Relaying Rail with angle plates.
One 10-ton Porter Locomotive, 30 in. gauge.

Prices given f. o. b. San Francisco.
Address S. D. BURNS,
318 BUSH STREET, SAN FRANCISCO.

FOR SALE.

ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Hannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

OLD BUILDINGS and CRANES of

The Risdon Iron Works,
SAN FRANCISCO, CAL.

FOR SALE, FOR REMOVAL,
Consisting of machine shop, foundry and boiler shop buildings, suitable for these purposes or for warehouse or storage buildings. Proposals received now and up to August 1st.

MINERS' AND PROSPECTORS' GUIDE

REVISED THIRD EDITION.
Published by JAMES IRVING & CO.,
128 N. Main St., Los Angeles, Cal.

Contains U. S. State and Territorial Mining Laws, as well as much useful information for miners and millmen.

50 Horse Power
TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~  
 Capacity of Engine, **50 HORSE POWER.**

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

The sun never sets on P & B Ready Roofing. It is used in China, Siberia, Australia, Hawaii, Alaska, North and South America, Europe and Africa—everywhere.

P & B Roofing will stand any climate—no matter how hot, how cold, how wet, how humid. It's the only ready roofing manufactured that will give the same satisfactory service, whether used in the Klondike or the Philippines. It never changes, deteriorates or rots on account of the temperature or climatic conditions.

It is proof against rats, mice, vermin, insects, ants, moths, gases, fumes, acids, smoke, fire and water. Anyone can lay it, and it will last for many years. Send for booklet—address Department A.

**PARAFFINE PAINT CO., 116 Battery St., S. F.**

## THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/2" wide by 1 1/2" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

## ASSESSMENT NOTICES.

**YUBA CONSOLIDATED GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of June, 1901, an assessment (No. 2) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 801, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of August, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
EDWARD H. STEARNS, Secretary.  
Office—Room 801, Claus Spreckels Building, San Francisco, California.

**CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1901, an assessment (No. 19) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 113 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24th day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
B. N. SHOCRAFT, Secretary.  
Office—113 Crocker Building, San Francisco, California.

**BUREA CONSOLIDATED DRIFT MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1901, an assessment (No. 31) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 214 Pine street, room 31, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24th day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. W. DIXON, Secretary.  
Office—214 Pine street, room 31, San Francisco, California.

**THE BUTTE BASIN GRAVEL MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of July, 1901, an assessment (No. 3) of One Cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at his office, 35 Stuart street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23d day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
O. E. HOLMES, Secretary.  
Office—No. 35 Stuart street, San Francisco, California.

## THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING. A 1-inch stream will furnish ample water for a 50-ton per hour machine.

CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings. The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

## CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from  $\frac{1}{2}$  to  $\frac{1}{2}$  greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

## WHAT OTHER PEOPLE SAY.

The International M. & D. Co., Canton, O. MATAPE, SONORA, MEXICO, April 23, 1901.  
GENTLEMEN:—"Our machine is truly a 'Wonder.' It is without a question the greatest machine of the kind I have ever seen in all my 47 years' experience in placer mining. A number of times I have had the machine fed up to 20 tons per hour and have held my hand in the water so that I could feel the gravel as it passed along the bottom and over the rim of the pan, and the bottom of the pan was clear all the time, showing that we might have fed it much faster without fear of choking it. I have panned over a hundred pans from the tailings of our machine, and have not yet found a single color in them. The machine is correct in principle and is absolutely perfect as a gold saver. It saves the finest gold, even flour gold."  
Respectfully,  
T. E. ANDREWS.

ELKHORN, COLO., April 13, 1901.  
GENTLEMEN:—"Your 'Wonder' Placer Machine is the greatest gold saver I have ever seen. One boy and myself are washing with the 18-inch, hand power machine, 2 tons of gravel per hour. I will commend your machines to all miners who want a first-class placer machine."  
Respectfully,  
A. Y. GORDON.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

**CYANIDE WORK**

and claim to have introduced the use of Cyanide to this Western country by the

**MACARTHUR-FORREST PATENT METHODS.**

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

137-139 Beale St., San Francisco, Cal.

Telephone James 1781.

## THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.

"We have used Leviathan Belting for four years, up to 34-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

## Twentieth Century Racine Launches.

**FOR BUSINESS  
OR PLEASURE.**

THESE boats are made by one of the oldest, largest and most successful boat-building concerns in the country, and we can demonstrate that we can give the best results for the least money. Fifteen to twenty-five foot launches and all size row boats carried in stock for immediate shipment. Any size gasoline launches up to fifty-foot. Launches as low as \$185.00. If complete boats are not desired, we can furnish machinery equipment. Electro vapor motors for launches combine absolute safety, economy and simplicity; in fact the maximum of power in the minimum of weight and space. An ideal motor designed and built upon scientific principles after actual experience; no experiment. No government restriction; no licensed engineer or pilot; no smokestack; no fire; no noise from exhaust; no naphtha under pressure; no heat; no disagreeable odor; no boiler, coal, wood or fireman required. The perfection of power for small launches. Every launch is run in the water over a measured course before shipment. Motors  $\frac{3}{4}$  to 6 horse power, single cylinder; 8 to 16 horse power, double cylinder; 18 to 24 horse power, triple cylinder. Send 10 cents in stamps for 80-page boat catalog.

# The Lunkenheimer Standard Injector.

UNIVERSALLY APPLICABLE.

This machine is warranted to show in actual service results hitherto unattainable with any other  
make of injector on the market. With feed water at 75° F., LIFT 8 FEET, it will work WITHOUT  
ADJUSTMENT OF STEAM OR WATER AT ALL PRESSURES FROM 40 TO 250 LBS. AND

BE GRADED OVER 50% AT ANY POINT in that  
range of work. Note carefully, ALL CONDI-  
TIONS ARE MENTIONED in this statement.  
The construction is simple and free from all  
complicated mechanism. All parts are easily  
accessible and tubes are very durable. In  
grading the capacity, the steam supply is  
cut down in proportion to the water, hence  
the discharge is cool and scale is not so liable  
to form.

It is thoroughly reliable and can be started  
promptly under the most extreme conditions,  
and UNLIKE many others its efficiency is not  
confined to any particular season of the year.  
The capacity increases with the pressure. A  
trial is solicited and satisfaction guaranteed.  
Write for Catalogue of superior brass and iron  
Steam Specialties.

# FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

## STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

## Illusions of Mining.

The accumulation of capital seeking employment as an evolutionary result of the general application of more exact and scientific methods to the carrying on of the agricultural, manufacturing and distributing industries has made a great and significant change in the relation of the mining industry to the general aggregate. A very few years since mining was regarded by the owners of this capital as a speculative and hazardous occupation, closely allied to gambling. It was not considered "legitimate" business; and in the older communities, if a business man of supposed moderate fortune became known as interested in a mine, it immediately suggested questions as to his solvency. It was suspected that the inducement to mine was a hope of recouping by for-

little in mining investment is too small to be a legitimate chance. At the other end the tendency is to give too much, to overlook the fact that the mine must not only give income, but must return within its life the principal sum of investment as well.

The fact regarding all mining business, with the exception of certain kinds of gold mining, is that the same economic laws apply as with other industrial businesses, and the same exact and scientific methods are not only applicable, but should always be applied. There are differences, it is true, but the differences are of detail of application of the methods and not of the principles.

Certain kinds of gold mining, placer mining and lode mining, where the recovery of the gold is economically independent of other metallurgical operations, are in a class by themselves. The problem of

neglected. It means mills and smelters for mines. It means the development of mines that carry gold enough to pay cost charges of reduction of the other metals as compared with mines that carry no gold.

The development of competition in mining and commercial organization to make it accomplish its object has been far more rapid than the general public comprehension of the effects. It has proceeded from the manufacturing and selling end of the business, taking next the metallurgical and reduction portion of it separate from the mining, finally including the transportation branch it is including the mining as far as needful to complete the economic unity. It has been based on the economic truth that the certainty of profit, economy of flat costs, and ability to withstand competition, were the most surely made certain when only one profit had to be provided for, when

View of Model of Ore Veins and Works G. V. Ex. Co. and Penn. M. Co., Grass Valley, Cal. (See page 44.)

tunate speculation some large losses made in what was termed "legitimate" business.

At the present time the point of view is in a transition stage. Mining is regarded as a legitimate activity for capital equally with agriculture, manufacturing and distribution. But the mass of people, whose capital is now turned to it for the chance of reproduction which in the other business is denied, consider mining as an occupation to which the economic laws that determine the measure of success in the other businesses do not apply. Its opportunities by them are gauged from the great speculative successes of its past history rather than from the average of all the enterprises. As a consequence, mistakes are being made and economic wastes incurred at both extremes. Prospects which may become mines, but which, if the average percentage of successful prospects to the whole number be considered, are far more likely not to become mines, have their possible future discounted precisely as if they were mines. At the other end a mine with ore bodies blocked out and values approximately measurable is invested in on the basis of income returns being assured indefinitely.

Both extremes are taking needless and unwarranted risks. The chance of a great deal for very

their mining is simple and direct. The recovered gold is the money of the world. Its money value is fixed and independent of supply and demand. Investment in mining rests simply on the proposition of not giving all of the recovered gold up as the cost of the recovery. There is no competitive production to protect against.

The mining of silver, copper, lead and other metals, particularly where associated with gold, is a commercial proposition dealing with variables at both ends. Competition in production is ceaseless. Invention is continually seeking cheaper substitutes. The tendency is continually to the leveling of percentages of profit. With these metals there is not only the risk of the mine, but the risk of the business as well. The investment in their mining must, therefore, be made conformable to the same economic principles that have made profit in other business. There is no waste too small not to be worth saving in mining. Every mine should be studied and developed as if it were a manufacturing business. Just exactly as the general business tendency is toward completion of all the steps of production from raw material to delivery to the consumer, by the producer of the raw material, so is the particular tendency in mining. It is a factor in mining business that cannot be

the mine was regarded merely as a natural storehouse of raw material. Therefore it is that while the profits of the mining business have increased and have been made more assured the profits of the mines have been if anything decreased and made more uncertain.

The mistake of the public has been to regard the first as if it were the second and to expect from the exploitation of mines what is being gained from the establishment of a mining business. Silver and lead mining as controlled by the close organization of the smelting and refining industry clearly shows this. The profits of the combination, the established business, are reported to be increasing. At the same time the sale prices of silver and lead are falling and with them the profit of lead and silver mine exploitation. Copper mining as an established business is largely profit earning, but the promoters of the establishment have taken the profits of that establishment, and the real problem of copper mining for people who would make the same profit is not the exploitation of a copper mine only, but the establishment of a copper mining business, the basis of which must be more cheaply produced copper, meaning richer mines than possessed by the present established business.

## Relation of Transportation to Mines.

One of the subjects discussed at the recent meeting of the Mining Congress at Boise was transportation of ores and metals. There was the declaration of a grievance—that many metal discoveries could not produce earning for their owners because the charges claimed for transportation service required so much of the metal product for payment that there was none or too little left for the owners' profit. There was an intimation of organization to effect a remedy—the mine owners are to work to organize all the industrial forces of the country interested in the subject for an effort to control or regulate the transportation business—presumably through political action.

The grievance has been declared before, not only by miners, for their industry, but by farmers, by manufacturers, by merchants, for their respective industries and occupations. It is invariably in evidence that the grievance appears with diminishing or disappearing profits in production or service. Also that, as a grievance, it is always independent of the real cause of the diminishing or disappearing profits. Perhaps the transportation business is indirectly responsible for the distortion of intelligence with which it is regarded. As a rule, its distribution of charges is not based on the cost to it of the service rendered, but on the margin of profit to the producer there is in the production that is transported. Knowing this, the producers permit it with approbation when there is left something for themselves; but when profit margins shrink from any cause, they expect the transportation business to carry the loss. Every locality can think of particular instances of the general proposition.

The grievance of the petroleum producers of California is excessive transportation charges on their production. If a true grievance, it existed just as certainly when oil at the wells was worth \$1 a barrel; as now, when oil is worth at the wells 25 cents a barrel; but, as a grievance against the transportation business, it was not declared until overproduction of petroleum, making competition between producers, wiped out the profit margin.

The grievance of the wheat growers of California is excessive local transportation charges. Just as with the petroleum producers, if truly a grievance with wheat on board ship worth 70 cents a cental, it was equally so with wheat on board ship worth \$1.20 a cental; but, as a grievance against the local transportation business, it is only declared with the disappearance of profit. The real cause, or the principal item of the total of several causes, is the development of the petroleum production in California,

which, displacing coal, has forced ships which formerly brought coal to California and took wheat away, to make their full earning from the wheat transportation alone, thus doubling the quantity of the wheat which is required to make the payment.

The transportation business is engaged in for the purpose of making profits. Whatever opinion may be as to the real relation of this business to the production of a country, and as to the principles on which the charges of its earnings are apportioned on different productions and services, the fact of its individual dominance over production and the principles of apportioning charges that it applies must be counted as established economic facts. They must by miners be taken into account as they are, not as the miner would like to have them.

Mining is also an industry engaged in for profit. Like other businesses, it must carry its own costs and risks. It has no preference over any other. It must itself pay as one of those costs, charges of transportation. Roads and railroads that are built based on expectations of profit from mining transportation have a right to the opportunity for those profits, and the fact that the earning power of a mine production diminishes, either as a consequence of the decreased unit metal content of the mine or decrease in the selling value of the metal unit, is not an equitable basis for a grievance against the transportation business. It is simply one of the risks that must be carried by the business. On the other hand, it may be a legitimate cause for the exercise of business policy by the railroad. There is a distinction.

Undoubtedly, as speakers at the Mining Congress declared, there are enormous minable deposits of valuable metals that have been discovered and appropriated, that the owners are unable to realize earning from, because the facilities for transportation either do not exist or the service of existing facilities in charges for payment takes too large a proportion of the metal. The condition, however, is not properly a grievance against the transportation business, nor a reason for the remedy proposed.

Stripped of sentiment and sophistry, the proposition is really a demand that the public give by the exercise of its political power to the owners of these mines such a rebate on transportation charges as shall enable the production of these mines to enter into competition with the mines that now have the established business, and which do not now receive gifts from the public but pay their own costs of transportation. There is no equitable or logical reason why the public should provide a bonus in transportation charges to one producer in mining rather than another, or indeed to any producer.

If the contention for the political aid of the public is based on the discrimination of the transportation business, which is a public utility, against the production of some mines to the advantage of other mines, it becomes another issue calling for the police power of the public, not for its charity.

The weakness underlying the whole condition is the idea that some way or other, the other fellow, the public, must be made to pay for what in the end is solely a private gain to some individuals of a special class. The vaguely and indefinitely expressed reason of public fostering of a special industry, the mining industry here, for a supposed public gain is fallacious. The expression of the public gain is not true. The thing actually meant is a real gain for the individual for which nothing is given to the public.

The real difficulty with which the owners of the metal deposits, who declare their grievance to be the transportation business, is that to work the deposits as mines will not pay because the metal cannot pay the unit cost charges under existing commercial conditions. The real problem for the owners is to reduce the costs themselves, if practicable. If impracticable, the metal deposit is not a mine. Industrially, the proposition must be examined to know if it will stand the commercial organization of similar metal mines against which it competes. The transportation of waste must be eliminated. Whatever new transportation facilities have to be created must be considered from the standpoint of ownership as part of the mining business.

In conclusion, mining is not an infant industry, and any metal deposit that requires nursing as a public charge is not a mine. The public have a right to consider the maintenance of an established mining business as of equal importance to the making of a

new business of the same kind at public cost for private benefit. The grievance of the owners of these unavailable metal deposits cannot be logically maintained. The proposed remedy has no standing either in morals or business.

## A Proposed Amendment to Lode Location Law.

In a paper read at the late meeting of the Mining Congress, W. B. Heyburn of Wallace, Idaho, proposed an amendment to the law of mining claim location, to avoid conflicts arising from errors in location due to uncertainty as to the strike of the apex of the lode. He proposed that all the end lines of locations on the same lode should be located parallel. To effect this, his suggestion was that the first locator on a ledge should claim a discovery of a new ledge, and the nearest U. S. deputy mineral surveyor should thereupon go to the claim, establish its strike by survey and fix the end lines. Subsequent locators should then be compelled to make their end lines parallel to these first established.

The principal objection to the proposition is that it could not do what it is devised for. Its proponent has failed to appreciate that it is a means of absolutely knowing the apex that creates the difficulty. It is not the lack of means of definition after it is known. The law as it exists is based on the theory that the apex is a fact capable of exact indisputable determination. Experience and knowledge have shown the theory at fault, and more and more at fault as knowledge extends. It is absurd to continue basing our rules of location on a theory known to be false. The adoption of Mr. Heyburn's proposed amendment would only make a bad matter worse.

The suggestion to require that locations should be made square and without extralateral rights, as this paper has presented it, is not answered by the objections he makes. The square form is a detail. It can be a rectangle, a triangle or any form of surface. The essence of it is in the limitation of right to the minerals to vertical bounding planes. It can not affect a vested right to extralateral rights already acquired. The rights to the mineral in the new location would be subject to such extralateral rights of entry and mining from the old form of location.

The gain is in the future; one of the new locations could not conflict with another one. The objection that the dip of veins would carry it outside the vertical bounding planes at too great depth to be desirable for location does not seem well taken. It is a question of probable pay. The discoverer of the mineral in place being entitled to the initial exercise of the right of location, the owner of the adjoining location who follows underground the valuable mineral from his location on to the other ground is the discoverer and has the prior right of location. Mere deductive influence that there is valuable mineral in the ground does not provide the legal basis of a location if it does supply the incentive to acquire that right by digging for and discovering that mineral at depth. Under the present law the valuable minerals do not stay put by location merely. Ore shoots have a dip with the lode strike as well as transverse to it. So dipping the ore shoots' cross-end lines of locations and in some actual instances are in precisely the relation that is objected to as a consequence of limitation of mining rights by vertical planes.

The Eureka-Idaho-Maryland lode of Grass Valley, Cal., is an instance directly in point. The shoot apex was in the Eureka, which was mined out early. Dipping in the strike, it entered the Idaho far below the surface and was mined out there. Still dipping, the shoot crossed the end line into the Maryland claim and is being mined there at the present time. It is notable that the vein does not outcrop at all on the Maryland location, but only appears at several hundred feet in depth. Its richness was such that as a commercial proposition the risk of sinking a shaft to discover it was warranted.

Project consciousness in advance and consider the suggested change as being the law in operation, the tendency would certainly be toward rapid exploration of deposits in order to get the advantage of discovery underground. The necessity of discovery as the basis of initiation of location would block mere obstructive occupancy of mineral land.

## The Memorial of the British Columbia Mining Association.

The British Columbia Mining Association, an organization of metal mine owners of the Province of British Columbia, has sent a memorial to the Governor-General-in-Council of the Dominion of Canada asking from the superior sovereignty of the Dominion of Canada a radical measure of relief from cost burdens imposed on their metal mining industry by the lesser sovereignty of the Province of British Columbia, to which the metal mining industry complaining is immediately politically subject.

The occasion of the memorial is successive cumulation of the effects of the legislative acts of the British Columbia Legislature during the last four years which has added so largely to operative costs of product that metal mining profits have been largely wiped out entirely, and what was originally a profit-earning business is now, as a whole, conducted at a loss. Capital invested in the mines has shrunk in exchange value till investment has been made uncertain and undesirable. All but a few mines have shut down. The industry is distinctly declining.

The claim is advanced that the legislative acts complained of had no warrant in public necessity but on the contrary that they were unnecessary and, it is plainly intimated, even designedly mischievous.

The British Columbia mine owners are to be commended for the square, direct declaration of the existing condition of their metal mining industry, the unqualified yet conservative statement of the facts that constitute the indictment, and the dignity of their appeal to a superior sovereignty for the equity that is denied them by the misguided beneficiaries of their thrift and industry. The condition is not the only example of its kind, though unquestionably the worst example. It is notable as the first occasion on which the condition was directly met by a true statement by the people interested. Usually the truth is suppressed and activity confined, not to correcting the condition, but to passing the burden of its cost on to others.

In detail the particular statements of facts and figures made part of the memorial are in substance as follows:

1. The taxes collected by the Dominion and Province from the metal mining industry during the fiscal year 1900-01 are declared to roughly approximate \$2,572,275 from a total metal value production of \$11,348,481 or 22.7% of the whole. In the direct incidence of this taxation the bulk of it goes directly on the production or the mine owner. There are specially enumerated: custom duties, which it is claimed increase operative expenses by 12%; the 2% on output, which takes from 6% to 12% of the net earning from medium and high-grade ores and wipes out entirely any net from the mining of low-grade ores, stopping their mining entirely; excessive fees for incorporation, registration, boiler inspection, recording, transferring title, miners' license, timber dues and others.

2. Oppressive, unwise, personal legislation, which has been added to by each successive Provincial Legislature: the eight-hour law, which has increased the cost of underground labor about 16%, and which has led to friction and separation of interests between employers and workmen, and has developed a class antagonism, which has led to the incessant urging of further class legislation. Unwise technical provisions in Mines Inspection Act, for example, the code of signals for shaft hoisting, which not only endangers life needlessly but restricts the hoisting capacity, thereby making it more costly. Acts, including the Alien Act, which make the obtaining of labor from outside the Province impracticable.

An examination of the preceding for first causes indicates conclusively the real source in personal legislation, the kind of legislation which has for its motive the taking of the personal property of some people for the ultimate if not immediate personal benefit of other people. The opportunity is the possession of the political power to legislate, associated with misguided intelligence and lack of responsibility to society as a whole. The last, concretely defined, is a corrupt Legislature, a majority of the people electing the Legislatures, who, while not at heart corrupt, allow themselves to be misguided.

The mines were rich. They were sought for by foreign capital. The mines and capital could pay large taxes, so the public has plucked both excessively to pay these taxes. For the easy enrichment of officials excessive and unnecessary fees have been imposed and collected. The workmen took their share of the loot in higher wages and fewer hours, each interest glutting on what it had still demanded and took increasing sums. At first the foreign capital paid, and wrote off what it paid as simply more investment. Now when the capital should be going back as metal production it is realized that to pay means that the investment will produce neither income nor come back itself.

British Columbia people are very largely people who labor for wages. A large proportion are late comers with no property interest in the country. The wage earners have been and are now so largely associated into unions that the unions are the dominating force in industry. They are as well the dominant political power and are responsible for legislation in British Columbia. The condition complained of as industrially impossible and unbearable by the owners of the metal mines is the natural, inevitable, logical result of such industrial dominance. There is a lesson in the condition to be learned in other places as well as in British Columbia. The city of San Francisco is at this moment the scene of a physical effort on the part of a labor union to obtain industrial dominance. What seems to have grown naturally as a weed in British Columbia is in San Francisco an exotic requiring force to make it grow. But if grown it will inevitably produce the same crop in San Francisco that is being harvested now in British Columbia.

The steps from industrial dominance to political dominance are possible, as British Columbia instances. The inevitable destruction of industry is shown by the condition of industry in British Columbia to-day. There is nothing to show that labor has correspondingly gained at the end of its run. The strike at Rossland, closing down the largest mines in the Province—the mines paying the highest wages and the largest proportion of metal output in wages—is a natural result of the irresponsibility of labor union dominance. Against a declining industry, it is clearly to be seen it could give nothing to the strikers that the strike was ostensibly a demand for. But it could hasten either one of two ends—either the end of the mining industry or the end of the labor union dominance. By the coming of either end the labor union must lose.

The memorial is specific in its statement of the particular acts—legislative and industrial—which have practically destroyed the metal mining industry of the Province. It is to be regretted that the memorialists did not clearly see and as directly declare the real basic cause of the condition. The acts were but the expressions of the cause. The cause was misguided, irresponsible, labor unionism.

The real labor union is not in the association of the men who labor in a particular trade or in a particular aggregation of trades. It is in a union of men who work for wages with the men who work capital, and its unit is an individual established business. The former idea developed, tends to drive men into classes with the direction for the individual ever downward. The latter idea tends to merge the classes with the direction for the individual ever upward. Are British Columbia workmen any better off now that they have created a condition which has separated them from the capital they were closely associated with four years ago? Will San Francisco workmen be better off when they have separated their interests from the capital which employs them? It might be noted that capital has practically left British Columbia, while the workmen remain—with the husks.

The Government of the Dominion of Canada should grant the Royal Commission of inquiry the memorial asks for. Its inquiry and the action of the Dominion Government should both go deeper than the surface effects. The underlying cause should be dragged into the light of free, fearless discussion and should be directly dealt with. Not alone to the memorialists will an equity be granted but organized society and industry, the State, will have the benefit that comes with the replacement of an economic error by the economic truth.

## Concentrates.

THE weight of a cubic foot of a natural bituminous rock, a sandstone with the voids filled with asphaltum, is from 120 pounds to 140 pounds.

SEA WATER has not been found in practice as satisfactory as fresh water for concentrating sulphurets. The poorer service seems to be due to the sea slime.

THE Secretary of the Interior has ruled that in obtaining a patent for a mining claim a mill which is situated on another claim cannot be credited to the first claim as improvement to establish the \$500 of expenditure required by law as a condition precedent to patent. The ruling was based on the argument that a mill, while an indirect benefit to a mining claim, yet it is of no direct benefit or aid to the actual development of the claim.

THE chief essentials to the production of high-grade Portland cement are the correctness of the proportions of the ingredients, thorough mixing and fine grinding of the raw material. A variation of one-half of 1% of the carbonate of calcium will affect the product. If too high in lime, the cement will expand and crack; if too low, it will be quick setting and lack in strength. Either defect, or both, at the same time may result also from imperfect mixing and grinding.

A LARGE English steamship building works has constructed one moderate sized steam vessel with steam turbines for its engines for commercial use in the English channel crossing, and offers to construct such vessels of any desired size for commercial service. It is probable that this advance in successful marine practice, the engines heretofore having been considered unavailable for commercial use owing to excessive fuel consumption, will shortly result in the development of economical types of these steam turbines for service as stationary prime movers.

A DITCH immediately on its completion has a less coefficient of water delivery than after it has been in use for one or more years. The loss by seepage is much greater at first. In time two results are obtained—silt works into the crevices and joint planes and stops the leakage of water through them, and the material, rock or earth, of the wet perimeter becomes saturated with water and receives less from capillary flow. A new ditch should not have its full head turned into it at the start. The turn-in should be small and gradually increased through several weeks, or even months, to the maximum. It is desirable to turn muddy water in at first, and until the maximum quantity is reached, to aid in closing up the seepage lines.

THE middle line of a tunnel being declared to be the division line between two ownerships on a ledge, and the tunnel itself not extending to the ledge, the prolongation of the middle line is the division line. If the tunnel is not straight, the prolonged middle line is the prolongation of the middle line of the straight section nearest to the ledge. If the nearest section instead of being straight is a turn or curve, the prolonged line of division is a tangent to the curve. In rock work of mining tunnels no such exactness of work is done that curves and tangents to them are absolutely determinate. There are limits of reasonable difference such that property interests dependent on their determination are within those limits matters to be adjusted by compromise.

IN shooting down holes in mine blasting, a substitute for tamping and a modification of the method of loading that successful use has demonstrated to be an improvement, consists in the use of water. The hole after being cleaned out thoroughly is filled with water. The paper wrapping of the powder sticks is removed and the powder is dumped into the water and sinks through it to the bottom of the hole. The primer is put in and the paper then is pushed through the water till in contact with the powder. So loading, the powder charge is compacted in the bottom of the hole, the strongest part; and a charge that loaded the ordinary dry way would fill 20 inches depth of the hole is compacted into 8 or 10. The water does not seem to affect the explosive power of the powder, and its position at the bottom of the hole adds to its power for breaking the rock.

A FLOWING STREAM applied to operate a current water wheel will develop power determinable as to amount by the same rule as would be used if it were developed by the discharge of water from a pipe against the buckets of a Pelton type of wheel. The velocity per minute of the stream impinging on the submerged blades of the water wheel is measured and the area of the submerged blade. From the velocity per minute the velocity in feet per second is obtained by dividing by 60, and the head or fall required to produce the fall is either taken directly from a table or calculated from the formula—head in feet equals 64.4, divided by the square of the velocity in feet per second. Then the head or fall of the water, multiplied by the area of the immersed blade of the wheel, multiplied by the velocity of flow in feet per minute, multiplied by 62.4 pounds (weight of cubic foot of water), divided by 33,000, gives the theoretical horse power. The effective horse power is, at its maximum, three-eighths of this for the current actuated water wheel, while 80% to 90% is effective with wheels of the Pelton type. Comparative tests for efficiency of a particular current water wheel should take this last figure as a standard.

## The Pennsylvania M. Co. vs. Grass Valley Exploration Co. Litigation.

Written for the MINING AND SCIENTIFIC PRESS

On this and the first page of this journal two illustrations—views of models used in the recently tried contest in the U. S. District Court at San Francisco between the Pennsylvania M. Co. and the Grass Valley Exploration Co.—show some very interesting phenomena of lode occurrence. The two mines are situate adjoining at Grass Valley, Nevada county, Cal. The models were prepared by the engineers of the Grass Valley Exploration Co. and, checked by the engineers of the Pennsylvania Co., were accepted by it as showing the facts, which were not contested. Issues were joined on their definition and interpretation.

In the illustration giving a general view of the underground openings of both mines and the respective veins exploited the mine works and veins shown on the right, and extending behind the plexus of works and veins shown on the left, are the works of the Grass Valley Exploration Co. and the ore vein claimed by it. The works and veins shown at the left, in front of the other, are the works of the Pennsylvania M. Co. and the veins claimed by it. It will be noted that the photographed string lines showing the latter veins and the blocks showing the mining works of the Pennsylvania M. Co. join into the plane

or, as the Pennsylvania geologists claimed, making one continuous vein in what can be compared to a series of steps.

Both companies passed their side lines in their underground works, coming under agricultural and townsite patented lands, which were subsequently bought by the Grass Valley Exploration Co. and used as the basis of a suit in ejectment against the Pennsylvania Co. The latter brought a separate action against the Grass Valley Exploration Co., claiming the apex of the vein.

The principal issue of interpretation that was joined was whether the lines of merging and crossing of veins having different lines of strike were junctions or intersections. The plaintiff's claim, by its geologist, was that the filling of the fissures with different strikes at the same period of time would make the mergings or crossings junctions, and the continuous line of the two or more, a single vein. The defendants claimed that the filling of the fissures at the same period was not material and did not determine identity. Their geologists divided the claimed continuous apex line of the Pennsylvania geologist into different intersecting veins, the apex lines of which they projected crossing the side lines of the Pennsylvania claim, the establishment of which would deprive the Pennsylvania claim of extralateral rights in the direction of the vein claimed by both. In opposition to the theory of step continuity advanced by the Pennsylvania side, the Grass Valley Exploration Co.'s geologists claimed that the phenomena of opposite dipping veins or feeders were the fillings of fissures

View of Model of Intersecting Veins and Works G. V. Ex. Co. and Penn. M. Co., Grass Valley, Cal.

of the vein claimed by the Grass Valley Exploration Co. at the bottom of the view. Below the line of joining only one vein line is declared developed. The ownership of this portion of the vein is in dispute and is the occasion of the litigation. The fact to be interpreted by the court from the geological structure is the answer to the question, broadly stated, Which of the veins above the line of the presumed separation into two veins is the upward continuation of the fissure of the single vein into which the underground works of both mines have advanced? That is to say, which of the two lines of ore-bearing rock at the surface on which the respective mines were located is the apex of the deep-lying lode?

From the testimony it appears that Kate Hayes hill, upon which both of the mines are located, was dug over the surface in the early days in placer mining principally, but to some extent in prospecting and mining quartz. These old workings practically obliterated the old apex lines so far as indisputable outcrops of quartz are to be identified. The absence of surface outcrop in the Grass Valley mines at the present time is common. The view was advanced that erosion had taken down perhaps 3000 feet of depth of Kate Hayes hill from its original structure at the time of the vein formation.

The report of the U. S. Geologic Survey, and the maps of it, show on Kate Hayes hill a series of approximately parallel quartz-filled fissures in the grano-diorite striking northwest and southeast, and in the vicinity of these two mines dipping southwest. In the prolongation north and south on the strike the dip is reversed, being toward the northeast.

Both the W. Y. O. D. shaft of the Grass Valley Exploration Co. and the Pennsylvania shaft are sunk on veins dipping to the southwest. In the underground works of both veins were discovered, striking differently from the supposed apex, lines running through the locations. Veins were also found in the explorations of the Pennsylvania Co. having the opposite dip, and connecting successive parallel veins,

of the other system, reference to which has been made above.

The illustration on this page is of a model showing workings of the Grass Valley Exploration Co. on one of the differently striking veins discovered in the underground exploitation, and intersections made by the Pennsylvania workings.

On the Pennsylvania side Ross E. Browne was the geologist, and W. F. Englebright, assisted by E. C. Uren, did the engineering work. For the Grass Valley Exploration Co. Louis Janin, W. S. Keyes and H. W. Turner were the geologists, and Mark B. Kerr, assisted by J. A. Jenkins and Karl F. Hoffman, did the engineering work.

### The British Columbia Mining Association's Memorial.

The Rossland Miner, referring to a memorial which has been presented to the Dominion Government by the British Columbia Mining Association, says: "It is unnecessary that we should indulge in much comment at the present time. No one who reads it can doubt that it is a very important document. It is asserted that the sum total of the artificial burdens due to human enactment which have been placed upon the mining industry in British Columbia is not equalled in any mining region in the world. That is an allegation sufficiently alarming, in all conscience; and all who have the true interests of British Columbia at heart should study the memorial in an attempt to ascertain if that allegation is founded on good reasons. We think that it is. That a crisis has arisen in connection with mining development in this province is plain from the concluding paragraphs of the memorial, which are as follows:

"In individual capacity, and as an association, we have repeatedly informed the Provincial Government of our distress and petitioned for relief. These requests, together with those for a commission to investigate the industry, have hitherto persistently

and invariably been ignored. So far from having any prospect of relief, every session of the Legislature sees new additions to the load, and still more severe legislation is being urged.

"Generally speaking, there is little hope for proper security for investors in British Columbia mines until this policy is changed and radical measures for relief adopted."

### The Sulphide Ore Problem.

Written for the MINING AND SCIENTIFIC PRESS by JAS. W. WORSEY.

Possibly no subject has occupied so much of the attention of scientific men of late years as the method of treating successfully the valuable mixed ores known as zinciferous lead sulphides, so abundant in many parts of the world, but very particularly so in Australia and adjacent countries. This ore is described as refractory—it cannot be treated in the ordinary furnace in the ordinary way. The writer has had some experience with it, and knows of endless trouble it has caused to English smelters in trying to reduce it to metal in their factories. One firm—the Runcorn Lead Smelting Co.—it ruined entirely, and their works were pulled down and sold. Still, the value of the ore and its great abundance in different countries has kept the chemist and metallurgist busy trying to solve the difficulty of easily and cheaply working it, so as to get the valuable metals out of it for the market. With this view fresh proposals in the form of patents appear at very short intervals, and have done so for the past fifteen years, till the sum total, I am told, in London amounts to over 400, involving the expenditure of many thousands of pounds. On perusing these specifications it becomes very clear that many of the inventors are not practical men in such industries, and what seems to be an easy thing in the laboratory proves altogether impracticable when tried in the works. In my next paper I propose to name some of the most noted specifications, and also to point out where they fail.

Doubtless this class of ore exists most abundantly of all other countries in Australia, and the Broken Hill mines have founded a most important industry on their large deposits. Other minerals exist there besides the class now being considered, as iron, copper, arsenic, kaolin, etc., but these are in the minority. Some of the ore which the writer has in his possession, and taken from bulk by himself, assayed:

|             |                  |
|-------------|------------------|
| Zinc.....   | 28%              |
| Lead.....   | 25%              |
| Silver..... | 34 ozs. per ton. |

Other samples I have taken of this mineral do not run so good, as, for instance, a sample of ore I met with in Swansea, Wales, assayed:

|             |                  |
|-------------|------------------|
| Zinc.....   | 23%              |
| Lead.....   | 18%              |
| Silver..... | 11 ozs. per ton. |

A parcel of like mineral I met with in London was assayed by a London firm of assayers, and they returned:

|              |                  |
|--------------|------------------|
| Lead.....    | 29%              |
| Zinc.....    | 18%              |
| Sulphur..... | 18%              |
| Silica.....  | 34%              |
| Silver.....  | 17 ozs. per ton. |

Other chemists who have examined the Broken Hill ore give an average of their work as a complete analysis:

|                |                 |
|----------------|-----------------|
| Lead.....      | 27.5%           |
| Manganese..... | 1.0%            |
| Sulphur.....   | 19.7%           |
| Zinc.....      | 23.0%           |
| Iron.....      | 7.5%            |
| Arsenic.....   | 0.4%            |
| Silica.....    | 20.0%           |
| Silver.....    | 8 ozs. per ton. |

A sample of similar mineral I had from the Mount Reid mines, in Tasmania, twelve months ago gave on my own assay:

|             |                   |
|-------------|-------------------|
| Lead.....   | 27%               |
| Zinc.....   | 33%               |
| Silver..... | 100 ozs. per ton. |

In Colorado some fifteen years ago the writer met with this zinciferous lead ore in many parts of the great Rockies, and an abundance of it is met with in Leadville. An assay representing a fair average of this mineral in that district was given by a local expert as:

|                    |                   |
|--------------------|-------------------|
| Zinc sulphide..... | 28%               |
| Iron.....          | 36%               |
| Galenite.....      | 16%               |
| Silica.....        | 20%               |
| Silver.....        | 12 ozs. per ton.  |
| Gold.....          | 0.05 oz. per ton. |

Readers will be struck with the great similarity of this mineral in countries so different and wide apart, and it may be very easily understood why so many and persistent efforts have been made in all directions to utilize so valuable a product of mother earth. At the Broken Hill mines they seem to have settled down to a system of dressing the ore by machinery, separating the argentiferous galena from the zinc-

blende, but this is at best only a partial success, for with the most careful attention and costly appliances the tailings contain a considerable proportion of the silver and lead contents of the ore they submit to this process. This dressing course seems to produce four qualities of material, viz.:

|                                                 | Pb. | Zn. | Ag.,<br>oz. per<br>ton. |
|-------------------------------------------------|-----|-----|-------------------------|
| Argentiferous galena concentrates assaying..... | 60% | 10% | 25-30                   |
| Middlings.....                                  | 15% | 25% | 10                      |
| Tailings.....                                   | 10% | 12% | 6                       |
| Slimes.....                                     | 30% | 20% | 20                      |

The rich concentrates come over to Europe and are sold to the smelters. An inferior concentrate they smelt themselves, while the middlings, etc., they stock in immense quantities for suitable treatment when such comes forward.

In Leadville, Colo., I am told, concentration is also followed of a similar nature to that in the Broken Hill district, and with a like loss in the tailings. These contain from 8% to 12% lead, and from 50% to 70% of the gold and silver in the ore is all that can be saved, while 20% to 40% of the lead is lost.

It may interest many of your readers to learn that the value of Broken Hill tailings on a good parcel that came under my notice only a few months ago, assaying

|             |                  |
|-------------|------------------|
| Lead .....  | 11%,             |
| Zinc.....   | 34%,             |
| Silver..... | 10 ozs. per ton, |

City of London or other convenient British port, was £2 10s per ton, spelter at the time being £18 per ton.

If we take the current price of the metallic contents of these middlings, we find that they total up to about £8 10s per ton, leaving, therefore, a working margin of about £6 per ton, if it be assumed that a total recovery of all the metals can be made, a thing scarcely possible in practice. Still, let me say that very wonderful things can be done with the very worst ore of the zinciferous tribe by a proper system of treatment and good working appliances.

(TO BE CONTINUED.)

#### Turbines Driving Mining Machinery.

The power employed to operate a large air compressor and generator in the power plant of the Boston & Montana Consolidated Copper & Silver Mining Co., Great Falls, Mont., is obtained from a plant consisting of two 54" McCormick turbines, herewith

illustrated, each mounted in a separate iron case, both discharging into one cast iron draft chest and plate steel draft tube. The outfit weighs 300,000 pounds, not including power connections, draft tubes nor the supply pipes. The manufacturers, the S. Morgan Smith Co., of York, Pa., say they are the heaviest pair of turbines built in America.

The wheels were tested at the Holyoke testing flume and developed 2800 H. P., under a head of 40 feet, with high efficiency at both full and part full gate. The speed is controlled by a Type "B" Lombard water-wheel governor. The gates are so accurately balanced that one man operates those of both wheels with ease.

THE Crown Mountain G. M. Co. of Dahlonega, Ga., preparing to work the ores of Crown mountain, near the courthouse at Dahlonega, has overcome the difficulty due to lack of water for sluicing by using electricity. Twelve miles distant is a good fall on the Chestatee river. Here an electric power plant has been erected. A pump station was placed on the bank of the Chestatee at the foot of Crown mountain and a 10-inch pipe line was laid to a reservoir at the summit, 1 mile distant and 560 feet higher. The reservoir has a capacity of 750,000 gallons. The triplex pump, driven by electricity transmitted by wire about 12 miles from the power plant, forces 1500 gallons of water per minute up and into the reservoir.

#### Method of Saving Fine Gold of Snake River, Idaho.

Written for the MINING AND SCIENTIFIC PRESS by  
WM. H. WASHBURN.

A commercial saving of the fine gold in the bars of Snake river was an unsolved problem for many years. Even a brief description of the various devices intended by the inventors to revolutionize gold mining, on that river at least, would fill a good-sized volume. As the mining of fine gold is yearly becoming of more importance, a brief description of some of the methods, out of which have been evolved the processes now most successfully used, may be of use to those engaged in mining fine gold under similar conditions elsewhere, even though on a small scale. For many years a modified form of rocker was most generally used, in which the sheet iron screen box was generally open at the back end, and the screen placed with a slight grade toward that end, so as to cause it to be self-discharging. The rocker was usually of ample size to allow room for the burlap and silver-plated copper plates, the latter being placed in the bottom of the rocker. We are told of the old-timer who once used amalgamated silver dollars as a substitute for the silvered plates, with good results. When amalgamated plates alone were used a portion of the gold (most of which appeared to be from the Boise river) would not amalgamate. Even a weak solution of cyanide, or nitric acid, seemed to have little effect upon it. The coating is said to be siliceous by those who have investigated it. For this reason the plates, when used, were generally preceded by burlap placed in the rocker in the usual way. Later, what is known as the beach machine found much favor, as it did not require motion.

The accompanying sketch (Fig. 1) will give an idea

FIG. 1.

of its construction, in which A is a sheet iron screen, having about  $\frac{1}{4}$ -inch holes, not more than  $\frac{1}{2}$  inch apart. This screen is set on an angle of 25° or 30°, or just steep enough so that the gravel will slowly slide over it, only when water is applied. B is another screen, placed horizontally above it and having slightly larger holes, farther apart. This screen is for the purpose of sprinkling the water over the gravel as it slides over the screen A, which is supplemented by a narrow strip of wire screen C across its lower end, to allow the last trace of fine sand and gold to fall on the plate D or in the sluice below.

D is a silver-plated copper plate, from 3 to 4 feet wide, and set on an incline of about 3 inches per foot. The sluice E leads from the foot of the table to a sluice or a table from 2 to 4 feet wide, which is lined with burlap, or Brussels carpet, to catch the rusty or coated gold that escapes from the plate D.

The greater part of the gold, however, was caught on the plate, though it was often in very poor condition from the excessive use of cyanide solution, or other chemicals, the gold adhering only in places over its surface in many cases. The water supply was usually had from some convenient ditch, or was pumped from the river by horse power, and delivered to the machine through the sluice G. With small machines the water was sometimes delivered by hand, with long-handled dippers, or a small pump. In this case the gravel was placed in a hopper or inclined chute at the upper end of the screen. The gravel was fed from the chute by dashing water upon it as often as required. With the larger machines the gravel was usually conveyed to the machine by wheelbarrows, or by horse scrapers, and dumped on the platform F, and thence shoveled onto the screen

A, though in a few cases a more or less automatic feed was used.

The capacity of this machine was from 25 to 50 cubic yards per day of ten hours, according to its size and the industry of the operators.

Considering its simplicity and cheapness, it is quite an effective gold saver. In fact, much of the mining on a small scale on the river is now done by these or similar machines. Another device often used for work in a small way consists of a sluice from 6 to 12 inches wide (according to the water supply), the bottom of which is covered by canton flannel. Over this a stout wire screen of about  $\frac{1}{4}$ -inch mesh is snugly laid and held in place by cleats along the sides of the sluice. The wire screen protects the burlaps from the wear of the coarser gravel, and allows the black sand and gold to settle and be caught by them until they are loaded, when they are removed, washed in a tub or vat, and replaced for another run. This plan works very well, provided the sluice is cleaned up often enough to save most of the black sand, as when it begins to go over some gold goes with it.

The first dredgers were of the centrifugal pump type, intended to suck the gravel and gold from the bottom of the river. They proved to be not adapted to this class of work, the larger gravel and boulders accumulating around the suction nozzle so as to interfere with the continued elevation of the finer stuff and gold. The amount of sand and gravel raised was also too variable in quantity in relation to the volume of water to give good results in saving the gold; besides, the amount of fuel required and the wear of the gravel on the pumping machinery was excessive.

We know of but one dredger of this type that met with a measure of success, which was had by annually skimming the top layer off the gravel from the open bars under the most favorable conditions.

The owners of this dredger have recently invested in one of the bucket elevator type, however, as being better adapted to the work.

The so-called clam shell, or orange peel, single bucket type was tried and found wanting, most of the fine sand and gold escaping through the openings in the bucket, back again into the river. The bucket elevator type of dredger was successful from the start, both in excavating the gravel and saving the gold, although the latter feature has since been much improved. The continuous and even supply of gravel it furnishes to the sluices and tables is of great advantage to the gold saving department. Trommel screens were in one or two cases tried, but were discarded, and so far as we know are not now in use on the river. As there are but few boulders, the necessity for their use seems not as great as in some other localities.

The sand and gold were at first run over silver-plated copper plates, in one case, at least, having a side shake and grade of  $\frac{1}{4}$  inch to 1 foot. On these the coated gold would pass over with the tailings, so they were abandoned also.

What are known as the Caribou riffles were then tried, and gave fairly good results. These riffles were made of sheets of steel, having  $\frac{1}{4}$ -inch holes, about  $\frac{1}{2}$  inch apart, 2 feet wide by 4 feet long, and about  $\frac{1}{2}$  inch thick, placed crosswise in a sluice 4 feet wide and about 50 feet long. There were two of these sluices, one on either side of the dredger. A bottom of canton flannel and burlap was first laid down, as was above described, for the wire screen sluice. Then the Caribou riffles were laid down, beginning at the lower end of the sluice. The lower edge of each sheet or riffle was raised about  $1\frac{1}{2}$  inch from the bottom of the sluice, and overlapping the one below it about 2 inches, and soup to the upper end of the sluice.

They were supported by wedge-shaped cleats at-

tached to their under sides. They required from 1½ to 1½ inch per foot grade. The gold adhered to the burlap under the protected spaces beneath the riffles. The burlap and wire-screen sluice before described was tried in one sluice, with but little apparent difference in saving, both seeming to save the gold fairly well, and would probably work very well in any fine-gold placer work in a small way. Cocoa matting was tried, but proved too coarse for such fine gold.

When the burlap became loaded with black sand, it was necessary to clean up the sluices, and, as the dredger had to be stopped to do this, the separate burlap tables were substituted, as they could be cleaned up while running.

The burlap washings, or concentrates, were at first run over silver-plated copper plates, 4 feet wide. Both the stationary and shaking type of table were tried, the first having about 2 inches per foot of grade and the latter about ½ inch per foot. The stationary tables seemed to work best, although neither would save the coated gold above mentioned, even after treatment with diluted nitric acid; so the concentrates were placed in a wooden revolving barrel, about 4 feet in diameter and 5 feet long, with some rocks, sufficient to have a grinding action on the gold, which was thereby scoured, so that it readily amalgamated on stationary silvered plates.

The screening of the black sand and gold from the gravel seemed to be the most difficult part of the problem to solve, and, after various plans were tried, the one finally adopted was as follows: After removing the Caribou riffles and wire screens, the bottom of the sluices were lined with canvas, tacked down snugly in place.

Over this was placed a continuous perforated plate screen, b. This screen is about ½ inch from the bottom of the sluice at the upper end, gradually raising to 1½ inch from the bottom at the lower end, and is supplemented by a wire screen, with increased grade, to allow all the water to enter the distributing sluice. As the gravel passes down the sluice, the fine sand and gold are screened through to the space between the screen and the canvas-lined bottom. About 60% is saved on this canvas, which is usually only cleaned up about once in a week's run. This clean-up is made by first removing the screens, and, after sprinkling the bottom of the sluices with mercury, the gold and black sand are carefully washed down to the lower end of the sluice, where a box is placed to receive it.

The washing is done by a hose with moderate pressure and a whisk broom. The gold adheres quite closely to the canvas and cannot easily be removed without the use of the broom and hose combined. When the sluice is in operation the sand is drawn off at the lower end, into the distributing sluice c (Fig.

sand over the head of each burlap. The best results are had by covering the tables with canvas, which is in turn covered with thin burlap. The grade of the screening sluice is ½ inch, distributing sluice ¼ inch, and of the burlap tables 1½ inch to 1 foot, respectively. The burlap tables and the distributing sluice are suspended by hangers, so arranged as to allow them always to remain level, independent of any possible list of the dredger. There are two main sluices, each 4 feet wide and about 50 feet long, one on either side of the dredger, and it would probably be an improvement were these arranged on hangers also. For grinding the concentrates a shallow iron grinding pan was substituted for the revolving wooden barrel with satisfactory results. This pan is about 5 feet in diameter and about 6 inches deep. Above it is a vertical shaft, having four arms, to which are attached a number of stone drags, in the fashion of an arrastra, and iron scrapers. Some mercury is added after grinding a light charge of concentrates about twenty minutes, and the concentrates and mercury added gradually and continuously until the lot is run through.

The sand overflows into an annular trough around the pan, which grades toward a mercury trap at one side, and from thence over a silver-plated copper plate, which seldom shows much gold, unless the pan is being overloaded. In cleaning up, most of the amalgam is found in the bottom of the pan.

There are modifications of the above described process in use on the different dredgers, but the description shows the main features of the most successful methods now in use on Snake river.

We are indebted to S. H. Washburne for details of some of the later improvements in the process used. He informs us that in September, 1899, from a run of 104 hours, he cleaned up \$510.41, from a second run of thirty-eight hours \$300, from a third run of forty-five hours \$417, and from a fourth run of six hours about \$130.

The hours named represent the time actually spent in digging pay gravel. With coal at \$7.50 per ton, the cost of operating the dredger was 3 cents per cubic yard, not including the wear and tear of the machinery.

It is not to be supposed, however, that such results are to be had continuously, as much of the pay gravel is covered by a barren overlay, and the pay streaks seem to be limited in depth and area. Judging from the observed lay of the pay streaks, we are of the opinion that the largest and most continuous bodies of pay gravel are most likely to be found at or near points on the river where the course of the channel has been held within narrow limits by banks of rock for a number of years. Where the valley is wider there are many good streaks, but they occur in patches, distributed over a large extent of country.

saved with it; third, that it is necessary to scour the gold in the concentrates by some form of grinding. With these principles carefully and intelligently carried out, there seems no reason why the percentage of gold saved should not be as high as 90, or even 95.

## Mining and Metallurgical Patents.

Patents Issued July 23, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR SEPARATING OR CONCENTRATING MINERALS OR ORES.—No. 678,860; H. P. H. Brumell, Buckingham, Canada.

A vessel adapted to contain a body of still water, a water-supplying pipe projecting into tank below water level, pipe being provided with nozzle having discharge directed toward a point of end wall of vessel intermediate water level and level of nozzle, whereby a thin stream of water will be projected against wall and deflected across surface of body of water in vessel to a discharge at opposite end of vessel, and a hopper to deliver material to be separated to stream.

WATER WHEEL.—No. 678,869; G. Gocher, Johnstown, Pa.

A frame, a series of fixed buckets, a series of movable buckets mounted in front of fixed buckets so as to receive water therefrom as the wheel revolves, each movable bucket comprising end disks or rollers, shafts passing centrally through disks or rollers and revolvably mounted on frame so as to permit movable buckets to rotate freely and completely, and trippers disposed in paths of end disks or rollers for rotating latter and movable buckets when they reach the lowest point of movement.

ORE OR GRAVEL CAR.—No. 679,033; F. Peteler, Minneapolis, Minn.

A car having swinging doors opened by pressure of material in car, vertically operating means extending lengthwise of doors for locking them in closed position, and device automatically actuated

FIG. 2.

FIG. 3.

2), a vertical view of which is shown in Fig. 3. This sluice is gradually narrowed by fifteen sheet iron divisions along one side at d, each division supplying one of these burlap tables, shown at e-e (Fig. 2). These tables are 4 feet wide and 6 feet long, and are arranged on slides, so they can be removed sideways to change and wash the burlap. There are fifteen of these to each main sluice, or thirty in all, giving a surface area of 720 square feet.

A simple semi-circular spreader distributes the

In a general way, the dredgers on the upper river seem to have the most financial success. Probably being nearer the source of the gold is in their favor, as it would be in ordinary placer ground.

After observing the results of the various gold-saving methods in use on Snake river in the past and present, we may safely conclude: first, that the sand should be screened to as near the size of the coarsest particles of gold as possible; second, that to save all the gold the black or other heavy sand should be

when car is moving in either direction to operate locking means and release doors.

**ORE WASHER.**—No. 679,100; C. F. Allen, San Francisco, Cal.

A sluice having sinks or riffles in its lower side, a magnetized plate in upper side of sluice, above sinks or riffles, and streamers adapted by current of water passing through sluice to cover magnetized plate and also mechanically prevent settling of magnetically attracted particles of ore on magnetic plate.

**CONCENTRATOR.**—No. 679,155; J. J. Montgomery, Santa Clara, Cal.

A vibrating table, having transverse slips above and removed from its bottom and immersed in water upon table, strips being set at an inclination to surface of table bottom, strips on opposite sides of a central portion of table having an opposite inclination and adapted to effect circulatory currents in water on table, whereby separated particles are moved to a central portion of table, a trough having feed chamber with delivery pipes to supply sand and water to table, suction pipes above central portion of table to which material has been directed by circulatory currents and adapted to withdraw lighter sand and water from table, a pump connected with pipes to effect suction, having a discharge into trough, exits from trough for sand and a communication in trough for permitting water therein to pass into feed chamber thereof, to be redelivered to table.

**BELT FOR ORE CONCENTRATOR.**—No. 679,248; F. W. Wood, San Francisco, Cal.

Side pieces, and a body or working surface composed of a plurality of plies of material, tucks formed in outer ply, rods inclosed by tucks, right-angular clips fitting inner corner of side pieces and each having an arm attached to one of rods, and another arm overlying face of side piece and secured thereto.

**Robins Belt Conveyors at British Columbia Copper Co.**

These cuts illustrate the use of belt conveyors built by the Robins Conveying Belt Co. at 15-21 Park Row, New York, at the sampling mill of the British Columbia Copper Co., just completed, at the Mother

Lode mine, Anaconda, B. C. Cut No. 1 gives a general view of the plant. Cut No. 2 shows the sorting conveyor in operation.

From the hoisting tower, seen at the back of the photograph, the ore passes over the grizzly bars, the fines dropping on to a 12" belt conveyor carrying them to the bins, while the coarse pieces are delivered to the crusher. A 36" sorting conveyor, 111 feet centers, receives the ore as it falls from the crusher and carries it to the bins. The waste, which is picked out by the men, as shown in Cut No. 2, is dropped into the chutes and falls onto a 12" belt conveyor, which carries it back and delivers it to the 16" waste conveyor, 540 feet centers, which can be seen in the left-hand portion of the photograph, running up the bank. The sorting at this mill is reported to cost 6 cents per ton. The Robins Conveying Belt Co. has just issued a largely illustrated book, descriptive of important plants recently installed, which will be mailed to any one applying for it.

### The Shanghai, China, Exchange.

China, with very few railway and telegraph lines, has fewer telephone lines or exchanges. The Ericsson Telephone Co. recently installed one of the first telephone switchboards at Shanghai, China.

translate the message into numbers, then telegraph the numbers, and finally where received translate the numbers back into Chinese characters.

The operation of the Ericsson full multiple switchboard is claimed by the manufacturers to be extremely simple, each section being divided into five panels for convenience, and in large boards an annex is placed at each end. The plugs and cords are placed on two different planes, the answering below and the calling above—an advantage to the operator, as the answering jacks are just above the answering plugs, thus separating them entirely from the calling plugs and multiple jacks. In case of a call, the operator answers and can connect directly from her own division with any other subscriber in the board, thus giving very quick service and saving the time of the calling subscriber and of the other operators. Each operator has eighteen pairs of cords and plugs, which provides for the busiest exchanges. As switchboards of this same pattern are already in operation in the United States, the Ericsson Co., 296 Broadway, New York, or their Pacific coast agents, the Electric Railway & Manufacturers' Supply Co., 68-72 First St., San Francisco, Cal., will take pleasure in giving further information to those who are interested.

MONGOLIA is the second great Province of the Chi-

Shanghai, China, Telephone Exchange.]

The illustration is of the first section, now in full operation. It is a full multiple board, made by L. M. Ericsson & Co., Stockholm, Sweden, designed for an ultimate capacity of 5000 subscribers. In the illustration it will be noted that, while the "chief" is a lady operator and was imported from Sweden with the switchboard, the others are all natives. It is said that they are remarkably apt in learning to operate, quick in their movements, and readily become expert operators. For service with the Chinese language the telephone is much superior to the telegraph. With the latter every Chinese character has a number, and in using the telegraph it is necessary to first

nese Empire to be opened up by the Russians. It lies directly west of Manchuria and is south of the Nertchinsk and Irkoutsk governments of Siberia. The Russians plan to build a railroad from Kiakta, on the boundary line of Mongolia and Siberia, directly across Mongolia to Peking. It will be a very short line, compared with either the Vladivostok or Port Arthur branches of the Transsiberian Railroad, and is, in fact, the natural line for the railroad from Europe to the Pacific ocean. It will open up a country of considerable mineral wealth, gold particularly, though less even is definitely known of it than of Manchuria.

General View of Plant of British Columbia Copper Co.

Robins Sorting Conveyor in Operation.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

#### KETCHIKAN.

Most of the prospects and mines on Prince of Wales island are so situated that wire tramways can be operated from them to tide water, where the largest ships can be safely loaded by gravity. The Copper Mountain, or Mellen & Reynolds property, is now operating a wire tramway 6000 feet in length, carrying the ore from an elevation of 3200 feet to the wharf at Copper Harbor.

The Alaska Industrial Co., a New York corporation, of which Senator Jones of Nevada, ex-Congressman S. W. Dorsey and Congressman Sulzer of New York are heavy stockholders, is employing forty men on its property at Copper Harbor. It has crosscut one ore body on its Jumbo claim, which shows 50 feet of chalcopryite ore that will assay about 6½% copper.

A Chicago company, on Skow Arm, has also a fine showing of copper. A 500-foot tunnel has been driven through hard rock and will cut the ledge at a depth of 400 feet on the vein, under a remarkable surface showing. G. McKenzie, Ketchikan, is Supt.

Copper Harbor, on the west coast of Prince of Wales island, the port of Copper Mountain, is rapidly becoming a mining camp. The Alaska Dev. S. Co. is working thirty-five men in the immediate vicinity of Copper Harbor, on development which shows improvement and is bringing pay ore into sight. On the summit of Copper Mountain, on the Mellen & Reynolds group, twenty men are working under supervision of Mr. Reynolds. Seven men are doing preliminary work on the Hetta Mountain group, in charge of W. T. Wright, and crews are also engaged on the Morrill & Houghton and Lowery & Woodbridge properties.

P. Clark, having bought the Iron Crown group at Tolstoi bay, Prince of Wales island, has begun to prospect them with a diamond drill, under the supervision of Mr. Butler. The Iron Crown shows an immense iron outcrop, carrying some gold and considerable copper pyrites. It is believed to be the capping of copper ore.

Allison, Baker & Wintermute have incorporated, capital \$200,000, to operate the Puyallup mine, on Kasaan peninsula, Prince of Wales island. The material for a 2-mile tramway from the mine to the beach has been bought and is being put in, so that the shipment of ore can be commenced.

The Mount Andrew M. Co., an English corporation, is operating the Mount Andrew group on Kasaan Peninsula, Prince of Wales island, on a large scale, doing development work. The ore is chalcopryite associated with magnetic iron. A. P. Swineford of Ketchikan is superintending the development of a copper proposition for himself and an Ohio company at Niblick Anchorage, Prince of Wales island.

### ARIZONA.

#### COCONINO COUNTY.

R. Baumgarth states that two companies are operating at Coconino now. The Petoskey, R. Lyon Supt., is the smaller and has ten claims. It has a leaching plant under continuous operation and several more tanks are to be put in at once. The special process employed is known as the Dean process and consists of breaking and crushing the ore to 20-30 mesh fineness, adding chemicals and getting the metal into solution. The solution is then run over scrap iron and the cement copper precipitated. The company gets water from the Warm springs on the Kanab side of the Buckskin mountains, pumping it about 500 feet high through ½ miles of pipe. The Coconino Co. owns forty claims at Coconino. It has a gravity water system supplied through a 7-mile pipeline. General Manager A. Nebeker is building a 100-ton leacher. The O'Neil process of leaching will be used there, and will reduce the copper to a 50% precipitate, which will then be smelted in the smelter which the company has already erected, after which its output will be shipped by team to Marysvale.

#### GILA COUNTY.

W. H. Case says the Fortuna mine shaft is down 1200 feet. On the 900-foot level a 12-foot body of free milling gold rock is being mined, and from the bottom of the working shaft a drift is being run to cut the ore body 300 feet lower. The mine is owned by C. D. Lane of San Francisco, Cal.

#### GRAHAM COUNTY.

G. P. Andrews, manager of the Pinal Copper Co., says work is progressing on

the Black Copper mine. The ore bodies look well and the mine is making a fair output of shipping ore.

#### PINAL COUNTY.

The final payments have been made by the Manhattan C. M. Co. for the Sutherland mines near Troy. C. H. Cutting, manager of the Troy Copper Co., is also manager of the Manhattan mines.

#### YAVAPAI COUNTY.

W. H. Wilson of Congress Junction has sold his option on the old Bullard mines to R. E. Fowler of Salt Lake City, Utah, acting, it is said, for New York people. The mines are near the Congress mine and carry copper and gold.

Work at the Verde King group is being pushed and good ore is being developed. J. Pella has a contract for sinking the shaft and B. Townsend a contract for running a new tunnel 200 feet. The Verde King group of twenty claims at Jerome is south of the United Verde.

A ledge has been discovered at Prescott said to be over 100 feet wide. G. H. Schuerman, G. Henry, T. Houlihan, J. Sparks, J. Turnbull and F. G. Plummer have located four claims and are prospecting it.

#### CALIFORNIA.

The State Mining Bureau has prepared complete maps of the copper-bearing section of Shasta county. The assistants to State Mineralogist Aubrey have largely completed the field work for the Bulletin to be issued on copper production in California. Prof. F. M. Anderson is still in Shasta county and J. H. Tibbits is in Sonoma.

#### AMADOR COUNTY.

The rebuilding and addition to the mill of the Keystone mine is completed.

#### BUTTE COUNTY.

New machinery is to be put in the Golden Trout mill at Lumpkin and other improvements made. Pending the construction a reduced number of men are working.

#### CALAVERAS COUNTY.

The Maxwell hydraulic mine on San Antonio ridge, conducted by E. C. Rigney, has cleaned up \$2000 for the last 40-day run and a total for the season of \$5000.

It is reported that operations at the Commodore mine, near San Andreas, will be commenced in a short time. Machinery will be installed at once and the shaft will be put down to a depth of 800 feet before crosscutting.

The company operating the Bovee mine, at Angels, are sinking a shaft on the Fritz mine, the north extension of the Bovee.

At the California-Ophir mine at Carsons the mill will soon be ready to start up. Electric power will be used for operating the mill and compressed air at the hoist.

G. W. Bowser of Whisky Slide, in the Mokelumne Hill district, says he has arranged to bond the Kenross mine and other claims to New York City people for four years, the property to be developed and partial payments made meanwhile.

A 30-day option on the Harmon copper property, at Campo Seco, is reported to have been granted at a high figure. The Campo Seco copper mines are being worked and said to be paying well.

The Golden Gate mine, at Angels, is to be developed by Stockton people, who say they expect to expend several thousand dollars in exploratory work.

The Lone Star gold mine, near West Point, after being closed down for a considerable time has resumed operations.

#### EL DORADO COUNTY.

The Starlight mine at El Dorado is running steadily.

Supt. Harpinding of the Church-Union mine has installed a new water hoist and is about to pump out an old 1600-foot shaft, to work the mine through it in the future.

J. C. Heald of Nashville has bonded six claims to New York people, who intend to develop them and have started work. It is intended to drive in a 700-foot tunnel.

Sinking on the Montezuma mine, at Nashville, has been resumed, and machinery, including electric drills, will be put in. J. C. Heald is superintendent.

The Rosebud mine, near Fairplay, has been sold, and extensive work begun by the new management. M. L. Smith, the former owner, is superintendent.

#### KERN COUNTY.

The Good Hope-Kinyon mine, at Randsburg, has been bought by people represented by W. J. Trask for, it is understood, about \$10,000. The 2-stamp mill, three dwelling houses at the mine and other property go with the mine.

#### MONO COUNTY.

The mill machinery of the Sweetwater Co. at Bodie is being installed. A cyanide plant has been ordered for immediate construction.

#### PLACER COUNTY.

Supt. H. M. Jarvis of the Bob Lewis No.

2 gravel mine, near Red Point, states that the new bedrock tunnel running to tap the channel is now in 200 feet. An air compressor and power drills are used. It is expected the channel will be reached in about 1200 feet.

The Jupiter Con. G. M. Co., operating a drift gold mine at Iowa Hill, has declared its first dividend.

#### SAN DIEGO COUNTY.

A Los Angeles company, headed by E. L. Baker, has bonded the Hodges mine on the Colorado river, opposite Cibola, Ariz., and are opening up large bodies of high-grade gold ore. The purchase price is said to be \$75,000, to be paid in installments as the mine is developed.

#### SHASTA COUNTY.

The company, including Senator J. P. Jones, which has bonded at \$45,000 the Kline & Wall copper claims in the Bully Hill district, will soon begin work on the property. J. M. Day of San Francisco, representing the bondholders, will be in charge.

P. Anderson has bought from C. E. Kircher a third interest in the Kennett mine; from D. Endicott a third interest in the Copper King and Copper Queen, and from Mrs. C. E. Kircher a one-third interest in the Lime Mountain claim. All are in Backbone district. Anderson is foreman at the Shasta King mine of the Trinity Copper Co.

Boswell & Johnson are shipping ore from their mine at Shasta. They are down about 50 feet and are drifting to the ledge.

A. M. Brewer reports that at the Mt. Shasta, at Stella, a ledge of rich ore is showing in the bottom of the shaft.

McFall & Hunting have struck a rich shoot in their mine near the Mt. Shasta, at Stella.

#### SIERRA COUNTY.

The Pride hydraulic mine on Deer creek has completed the season's run and cleaned up \$9000. The mine is owned by B. Pride, A. Pride, B. Babb, N. B. Willets and others.

The Fir Cap mine, near Downieville, is installing air pipe preparatory to beginning work in the face of the tunnel. J. Erwin is foreman.

H. Kingdon and others of Poverty Hill have bonded the Poverty Hill hydraulic mine to A. Winter and associates of New York City.

#### SISKIYOU COUNTY.

A pack train is taking ore from the Jim Budd quartz claim on White gulch, near Sawyer's Bar, owned by Hickey Bros. They will make a crushing at the Jumbo mill of about thirty tons of ore, that is said will go about \$50 a ton.

A rich vein of ore was uncovered recently by Clement, Downing & Son, near Pack Saddle camp, on Blue Ridge, near Sawyer's Bar. It is said to be a blanket ledge and to prospect \$40 a ton.

The new 300-foot tunnel being run at the Las Parias mine, on the South Fork of Salmon, is completed and has opened up a vein of ore from 14 to 20 feet in width. Their assays go from \$10 to \$30 to the ton. O. Herschey, Forks of Salmon, is Supt.

#### TRINITY COUNTY.

Work on the Sweepstake pipe line is being pushed rapidly. The S. F. Construction Co. is making good headway in excavating the trench for the pipes, and the pipe men have started making the pipe. At the mine the ground is being cleared for a reservoir.

#### TUOLUMNE COUNTY.

The Tuolumne Power & Dev. Co. has been incorporated with principal office at East Orange, N. J., and branch office San Francisco, to make a water power development from the main Tuolumne river at Jacksonville. C. F. Linder, of Jacksonville, is president, B. S. Tyler, of San Francisco, secretary.

Twenty men are employed at the Mack mine, at Big Oak Flat. Sinking of the new shaft is being pushed, and the old works are being put in shape for working. It is the purpose now to put twenty stamps in the mill at the start.

The Mary Ellen mine, on Tuolumne river, near the Mohican M. Co.'s mines, has been bonded to Los Angeles parties for \$15,000—\$500 cash paid down. It is said a mill will be erected at once.

A. M. Williams, the Supt. of the Felicitana, near Jacksonville, with R. S. Enslow, is opening up the Badger mine, near Jamestown. G. E. Stayton is Supt. for them.

J. M. Meighan is reported to have bonded the Mt. Jefferson mine and will resume its operation at once. The shaft is to be sunk 300 feet deeper, levels run and the mill started up.

A strike of free-gold ore has been made on the Wilkinsons claim, on the Tuolumne river. The vein runs easterly and westerly and is very strong.

#### YUBA COUNTY.

The work of prospecting on the O'Brien tract at Newbert has so far advanced that

a sale of the land for dredger mining is considered assured. J. E. Doolittle, one of the prospective buyers, is on the ground. The price agreed upon for the land is said to be \$70 an acre.

### COLORADO.

#### BOULDER COUNTY.

A streak of ore going eight ounces gold per ton has been struck in the 70-foot level of the Red Lion mine at Bloomerville.

#### CHAFFEE COUNTY.

The ground has been graded for the reduction works at Garfield.—A few men are at work in the Eclipse mine preparing for ore production when the plant is ready to operate.

The Stockton, at Cleora, is now having an air upraise made from the tunnel. As soon as completed the tunnel will be advanced 300 feet farther, to thoroughly prospect the ground.

Kennedy & Spellman of New York City have taken an option on the Sir Thomas Lipton claim, near Buena Vista. It is the intention to secure the claims on Mount Carmel and develop the mountain by driving a tunnel.

#### CLEAR CREEK COUNTY.

C. K. Wolfe of Georgetown has taken a three years' lease on the Kirtley group and will begin operations at once. The Kirtley has been idle for several years.

#### CUSTER COUNTY.

The Hard Times M. Co. has been incorporated by C. Rhodes of Chicago, Ill., and J. A. Park and J. H. McCorkle of Pueblo, capital \$10,000, to mine at Silver Cliff.

#### DOLORES COUNTY.

The Rico M. & M. Co., operating the Atlantic Cable mines, is adding to its milling plant at Rico and the mill capacity is now doubled; further additions are under consideration.

#### GILPIN COUNTY.

The Hampton mine, in Russell district, near Blackhawk, is shipping concentrates returning \$38.60 to \$72 a ton. The vein is 42 inches wide and the ore concentrates 3 or 4 to 1. N. C. Hughes is manager.

The Stewart G. M. Co. has been incorporated, capital \$1,000,000, Portland, Me., being the principal office. The incorporators are G. A. Purbeck, N. J. Wheeler, W. H. Bowen, J. E. Blakemore, C. A. Clark, E. A. J. Foote and H. L. Crane, with J. Gilmore of Central City as resident agent. It proposes to operate the Stewart mining properties in Hawkeye district, near Central City.

The Ophir mine, at Nevada, has increased its working force. The average product of milling ore runs from fifteen to twenty tons per day, the smelting product being from ten tons and up per month. This property is owned locally. A. Waters is superintendent.

H. J. Sevis and associates have leased a portion of the Bobtail lode, at Black Hawk, from L. H. Stockbridge, manager of the Boston & Denver Con. M. & M. Co.

The Mascot group, in Pine Creek district, near Central City, has resumed operations after a two years' shut down. The property is to be operated by the Boston Occident G. M. & M. Co., in which Massachusetts people are interested. R. Brown has been appointed foreman in charge.

Denver people are planning to start up the C. P. W. mine at Black Hawk.

Rose M. Benoit has sold to the Palace M. & M. Co., for \$10,000, the Palace, Pied Piper, Two-Fifty, Highlander and Poor Man claims, in the Silver Lake district. It is reported that work is to be started on the group at once.

The Edna G. M. & M. Co. has been incorporated, capital \$50,000, by F. P. Miles, Ida Smith and A. H. Smith, to operate the Consumption property in Como Lake district, near Central City. The property has been opened up by a tunnel. Ore carrying a high percentage of lead has been taken out.

E. J. Channing has given to the Little Kingdom M. Co. a two years' lease and option, at \$8000, on the Etta, Maggie, Chafey, Make and Mary lodes, in Pleasant Valley district, near Central City.

#### HINSDALE COUNTY.

The strike reported in the Henson creek lead mines group at Lake City is said to be proving better as development extends in it. Besides a streak of shipping ore, there are 4 feet of milling ore in the breast. The power plant being built by the company is being pushed to completion to provide air for power drills.

#### LAKE COUNTY.

The South Winnie Leasing Co. of Leadville, operating on a lease, has paid its second dividend of \$5000 within four months. They are taking out ten tons daily of \$30 ore and occasional lots which assays as high as thirty ounces silver, twenty-one ounces gold and 30% lead. The owners are very confident that they have the making of a

big mine out of their lease. It embraces five acres for a term of years.

The lessees on the Blonger, on Fryer hill, at Leadville, have good indications for a regular shipping property. In driving for air they struck a good iron body which pays to ship and which is improving.

The Highland Mary mine, at Leadville, is being reopened by lessees. It is expected that the same ore body found in the Gallagher (adjacent) will be opened up, and shipments will be made from the old dump, which contains good silver values.

Denver people are interested in a five-year lease on a twenty-acre tract on Little Ellen hill, Leadville. The new company is known as the Forest City L. & M. Co. and has been incorporated by G. S. Codrey, E. B. Coe, A. W. Patton, F. C. Goudy, C. Field, M. B. Carpenter and J. Lindsey. They expect to open up the same ore body which the Resurrection and New Monarch companies have.

The lessees of the Louise claim, at Leadville, have found a vein of good grade oxidized ore lying on the quartzite, and are now developing it. The ore is from 3 to 4 feet wide and will average 0.2 of an ounce of gold, 30 ounces silver and 30% lead.

#### SAGUACHE COUNTY.

S. D. Bullington of Florence has been inspecting the mines owned by P. R. Harpel, B. W. Mencer and other Iowa people. He says there are eight claims near Villa Grove with 500 tons of copper ore already on the dump, assaying from \$15 to \$50 per ton, copper predominating, but some lead, silver and gold. It is probable that a 20-ton smelter will be erected at the mine this year.

#### TELLER COUNTY.

The Gold Ex. T. Co. has begun on its second mile from the Cripple Creek end of the tunnel over to the Victor mine. The heading of the tunnel is now advanced 6000 feet and operations are being carried on in the Little Clara claim. The tunnel, as at first projected, is now about half completed and is every day believed to be getting closer to rich ground.

Bad air is being generally complained of in many of the mines of Cripple Creek district, and several companies are experimenting with methods of air purification. Chemicals have not proven effective in ridding the mines of poisonous gases. Fans and blowers so far as used have not produced desired results, and now the mining engineers of note are being asked for advice concerning the problem.

The Twin Sisters M. & M. Co. has leased to J. Wood and J. Connors the company's Raven hill ground at Cripple Creek for thirty months. It stipulates fifty-two shifts a month, a new 200-foot shaft and 20% flat royalties.

The co-operative drainage plan outlined by the three largest companies on Raven hill, at Cripple Creek, has been received favorably. The idea is to run a tunnel that will cut the Elkton a little below its present depth and continue it through the hill to connect with the Doctor-Jack Pot and Mary McKinney. The cost would be a great deal less than the three companies could save in pumping.

The shaft on the Blue Bell is completed to the 250-foot level and the lessee—G. Kurt—has resumed work. In the 180-foot level considerable development work is being done and ore is being saved.

The Solitaire Co., operating the Columbia claim at Cripple Creek, has struck the same ore shoot at the 400-foot level which was opened in the 340-foot level.

#### IDAHO.

##### BLAINE COUNTY.

H. L. Childs is operating on the South Boise, 28 miles from Soldier, for a New York company owning 660 acres of placer ground along the river. He states that prospecting with drills the results are satisfactory and a dredger will be bought and installed next season. Tests show the ground carries 40 cents a cubic yard in coarse gold. An Ohio company has bought a large tract of ground adjacent and will work it, using a dredger. The company is represented by C. W. Purcell.

##### IDAHO COUNTY.

A strike is reported on the Blue Dragon lead, in the Elk district, a 5-foot seam of ore assaying \$49 per ton having been developed on the 100-foot level. The mine is owned by the Alamance Co. of San Francisco, which has built a new mill on the property.

The Rhett Creek M. & M. Co. has been incorporated by F. Hye, J. Pierson, W. Hye and L. Hye, all of Spokane, Wash., with capital of \$1,000,000. A branch office will be at Dixie, Idaho, where the mines of the company are located.

W. Mack of Spokane, Supt., has started work on the Sixty-four quartz claim at Dixie, owned by W. J. C. Wakefield and T. Garrison of Spokane, R. Dennsler of Greenwood, J. Morris of Rossland and others. The ledge has a pay streak of

18 inches that averages over \$50 per ton in free milling gold.

#### KOOTENAI COUNTY.

J. P. Salzer, general manager of the Gold Coin Co.'s gold mine at Black lake, has made arrangements for the construction of a cyanide plant for the ore treatment, and expects to have the mill in operation before winter.

At the Keep Cool mine, Lake Pend d'Oreille, near Lakeview, the face of No. 5 tunnel is in solid ore. Three tons of ore have been shipped to determine the best process of treating the ore preparatory to installing a plant. The values are in lead and silver.

#### LEMHI COUNTY.

The Mormon Boy group, near Salmon City, owned by the Messrs. Goss of Salt Lake City, Utah, is reported by L. Gilson, who recently examined it, to have no less than 6 feet of free milling ore, averaging \$12 per ton. There is a small mill on the property.

#### SHOSHONE COUNTY.

Clark & Sweeney and the Empire State Idaho M. & Dev. Co. have been sued by W. C. Murphy of Missoula, Mont., who alleges that he was deceived by the defendant into selling his one-eighth interest in the Skookum claim in the Cœur d'Alene district for \$2000 when it was worth hundreds of thousands of dollars.

The Bitter Root Mountain M. Co. is running a tunnel to the ledge in its mine on Placer creek, near Wallace. The company is a Spokane corporation. E. B. Van Osdel is president and F. A. Edgerton secretary.

#### MONTANA.

##### DEER LODGE COUNTY.

F. Cannon is developing a mine near Lincoln which shows a vein 7 feet wide carrying free milling gold.

##### FERGUS COUNTY.

The Great Northern M. & Dev. Co., at Gilt Edge, is prospecting on its various properties in addition to keeping its mill running steadily with an average monthly production of about \$33,000. On the Stand By group, west of the Chickadee, a great deal of ore has been exposed on the surface. On the Cuba lode of the Gilt Edge group, a tunnel has been driven 500 feet to cut a body of ore exposed in a shaft on the hill above. On the Homestake a shaft has been sunk 65 feet, which shows ore suitable for cyanide treatment for its entire depth.

##### LEWIS AND CLARKE COUNTY.

The Buckeye mine and mill at the head of Basin creek has been bought by C. J. Davis and W. Judson of Lansing, Mich. W. Thompson is superintendent. The price is said to have been about \$50,000, some paid down. A new shaft will be sunk. There is a 35-ton concentrator on the mine.

T. E. Collins, J. L. Main and associates are forming a company to operate the cyanide process in Montana. A contract to treat the tailings and ore of the Empire mine has been made and a 500-ton plant is being built at that mine. They are building a similar plant at the Prize mine on Granite Butte.

C. M. Sheldon, operating the Howard mine at Helena, says the mine has enough second-class, free-milling ore opened up in the stopes and on the dump to run a 10-stamp mill for a year, and, in addition, a large quantity of high-grade shipping ore in the new stopes.

J. McIrvin has leased and bonded the Aetna, near Elliston, to J. D. Walcott & Co. of Colorado. The mine has a shaft 150 feet deep, equipped with a whim. The last shipment of ore is reported to have yielded \$210 per ton in gold.

T. Fitzgerald, representing St. Louis people, is developing a group consisting of sixteen claims, near Helena, by surface cuts and shafts. The surface indications are considered promising.

The Hamilton Co. of Cleveland, Ohio, which is developing the Yellow Jacket mine at Helena, has its shaft down 100 feet and is preparing to erect a steam hoist. The ore is said to average about \$8 in gold. It is intended to erect a cyanide plant to treat it.

##### MADISON COUNTY.

W. B. Millard of Nebraska has taken an eighteen months' lease and bond on the Kearsarge mine, at Summit, and has begun work on the property.

Major Isdell is working the Whippoorwill, a claim owned by himself and M. Green, on Mineral hill, at Pony. The claim is developed by a 60-foot shaft in ore that it is claimed goes about \$50 a ton.

##### MISSOULA COUNTY.

(Special Correspondence).—The Deer Creek G. M. & M. Co. at De Borgia is a close corporation of Philadelphia and New York people, capital \$10,000,000. They are engaged in fitting up their placer mines for operation. The claims comprise about 7 miles of gulch dig-

gings. The installed plant consists of an elevator with two giants. Water brought through a 3-mile flume is used under 400 feet head. The company also own and are prospecting a number of adjacent free milling gold-bearing quartz ledges in quartzite formation. In the rock formation quartzite instead of slate resides the principal geological difference from the Cœur d'Alene country, which includes the western slope of the Bitter Root range, De Borgia being on the eastern slope. The slates carry silver-lead ore deposits, the quartzite free gold and an inconsequential amount of sulphides.

De Borgia, July 20.

#### PARK COUNTY.

The Mammoth tunnel in the Gilt Edge district is now in 150 feet. The time for the option of \$100,000, held by W. L. Lawrey for New York people, has been extended until the tunnel can be driven 100 feet farther, when it is expected that the ore bodies exposed on the hill above will have been reached.

#### SILVER BOW COUNTY.

(Special Correspondence).—The mine of the Speculator M. Co., at Butte, is situated in the vicinity of the Modoc, High Ore and Bell, on the slope of the hill facing Meaderville. The property is on one of the east and west ore ledges and is opened through a 1200-foot vertical shaft that sinks about 100 to 150 feet north of the ore body. From each 100-foot station a crosscut runs southward to the ore ledge. A large amount of drifting has been done on each level from the surface down to the 1200, and ore is stope out to considerable extent from the various upper levels. The twelfth level stopes run ten sets high at a point opposite the shaft, with the work proceeding eastward. The timbering is in square sets of the heaviest character. From each shipping level two chutes are built upward to the various stopping floors; one chute receives the smelting ore and the other the ore intended for milling. Thus the ore is sorted in the stopes into the two grades. The ore ledge ranges from 5 to 40 feet wide and is next to granite walls. The ore at the 1200 level carries a considerable amount of iron in some places. Some 300 to 400 tons daily are being hoisted. On the surface is a brick shaft-house, with good hoisting facilities, having air compressor and heavy boilers and a steel self-supporting smokestack. The work is under the management of W. W. Wishon, with P. Sheehan as foreman.

Butte, July 27.

A 5-foot vein of copper ore has been struck 490 feet down on the Sinbad claim, at Butte. The property is being worked by the Largey estate and M. Genzberger, the latter being manager.

#### NEVADA.

##### EUREKA COUNTY.

The \$30,000 option on which W. D. Thompson and A. K. Tiernan have been operating the Bay State mine, at Eureka, has been bought by R. Evans of Salt Lake City, Utah.

##### LANDER COUNTY.

Plans for the proposed 40-stamp mill for the New Pass mines, recently bought by W. F. Synder and his associates of Salt Lake City, are completed, and bids for construction will be soon asked for. The management desires to build the plant this year and begin the working of nearly 30,000 tons, said to be in sight.

##### LYON COUNTY.

The Lagerbeer mine, near Silver City, formerly included in the old Succor ground, is claimed to have produced over \$35,000 in gold bullion in the last six months, and is still producing ore.

##### NYE COUNTY.

The shaft on the lease of Burgess, Argus, Spenker, Livesley, Sunderland and Knapp, known as the "Never Sweat" lease, situated at the base of Oddie mountain, Tonapah, and the highest workings up on the mountain, is down 120 feet and has struck the ledge, the rock assaying \$240 per ton.

##### WASHOE COUNTY.

The California & Nevada C. M. & S. Co., J. Niebuhr Sec., at Reno, is working a group of claims on Peavine mountain, and, it is said, intends shortly to put up a smelter for its own and custom use.

##### WHITE PINE COUNTY.

L. Smith of Elmira, N. Y., and A. C. Barton of Murfreesboro, N. C., are in Ely to examine the properties of the Canton Co. in the interest of people who have subscribed for stock in the company now being formed for their development.

Suit has been commenced in the U. S. Court, Carson City, by Mrs. Ida McKinley and Mrs. Mary B. Barber against J. Steele, W. Hayes and others to recover possession of the Elijah mine, one of the patented claims of the Can-

ton M. Co., which it is alleged the defendants are operating, and also for \$10,000 damages, for the ore taken out by the defendants. Mr. Steele is the owner of the Macon City mine adjoining the Elijah, and denies that he has at any time extracted ore from the patented claim, all his workings being well within his own lines.

#### NEW MEXICO.

##### COLFAX COUNTY.

A. B. Gray, A. F. Griffith and others of Denver, Colo., have incorporated the Empress Free Gold M. & M. Co., capital \$1,500,000, to operate in Colfax county, New Mexico.

##### EDDY COUNTY.

W. C. McDonald and I. Bolles of Carlsbad, prospecting in the Guadalupe mountains, have discovered a large body of copper ore of high grade. They state that there are at least 100 carloads of the ore in sight in float.

##### SANTA FE COUNTY.

The Jones copper mines in the Maluchet district, near Santa Fe, have been bought by A. R. Gibson. He expects to begin work on the property at once. The ore body is said to be 12 feet wide, carrying 9% to 20% copper and \$12 gold a ton.

#### OREGON.

##### GRANT COUNTY.

(Special Correspondence).—The Belcher property is situated  $\frac{1}{4}$  miles south of Alamo, near the head of Olive creek. This was purchased by G. W. Daines of Illinois through W. H. Jackson, the latter being now in charge of developments. Two tunnels have been started, the lower having been driven 650 feet on the strike of one of the known ledges. The ores are similar to those already described in the Alamo district. Mr. Jackson is erecting buildings and is considering the matter of putting up a stamp mill.

The Strasburg is on the eastern slope of Quebec mountain. It belongs to W. H. Remington of Tacoma and Francis Clarino of Portland, with others. There appear to be three ledges here, which have been cut by a crosscut tunnel.

Among the newer properties in this district the Concord group, belonging to the Concord G. M. Co., is one of the best developed. It sidelines with the Red Boy group on the west, covering a ledge that runs parallel with those of the latter and a fraction that carries the southern portion of the Red Boy's Blaine vein. The parallel ledges on the two groups run north and south, through a belt of slate, which is bounded by a granite formation about 1 mile toward the west. A porphyry dike cuts diagonally through the two groups from northwest to southeast, and where it cuts through the ledges of ore the latter are slightly displaced.

The Concord is opened through a main tunnel that starts at a point 100 feet higher than the main tunnel on the Red Boy group. This tunnel goes 195 feet through barren ground, thence 400 feet northward on the vein, to where the latter is displaced by the porphyry dike. Cutting through the latter, the vein is again picked up by a crosscut 75 feet to the west. The main tunnel is continued on diagonally to this vein, on which the drift is carried 180 feet. At a point 90 feet north of the porphyry dike a crosscut runs eastward 200 feet to the Blaine vein, the drift thereon being carried 330 feet northerly toward the Red Boy workings. This Blaine vein is about 5 feet wide and carries high-grade ore. The main Concord vein, described above, is 25 feet wide in some places. The work on the group aggregates about 2000 feet. The vein material is a quartz, altered slate and porphyry, all more or less mineralized. At the water level, below the tunnel, the ores become more of a sulphide than those above. The tunnel work, when pushed farther on, will cut the apex of the hill at 500 feet depth. W. W. Robbins, general manager, C. B. Wade, J. H. Robbins, J. A. Howard and C. C. Robbins are trustees.

Granite, July 20.

(Special Correspondence).—The Red Boy mine and its underground workings have been previously described in these columns. It is a property that long has taken rank as one of the best producers in eastern Oregon. Since my former visit here the veins have been more thoroughly opened and many surface improvements are noted. A three-compartment shaft, now at a depth of 200 feet, is sinking at a point 50 feet above the main tunnel. An excellent shaft house, with heavy gallow-frame, has been erected; it includes hoist, compressor and boiler rooms. The hoisting engine has double reel and is capable of operating to 2500 feet depth. The compressor is of the Reidler type and is the right-hand side of a duplex. The four boilers are capable of 180 H. P. each. A pump is set at the 200-foot station in the shaft. When the shaft reaches 200 feet

below the main tunnel level a crosscut will be driven 300 to 400 feet to the vein, which will enable them to stoop on the ore body up to the old workings. From a point in the old workings a crosscut is being driven from the Red Boy vein westward to the Blain vein. It has progressed about 1400 feet, and they expect to cut the latter vein at about 100 feet farther. There are already extensive drifts on the Monarch and Red Boy veins. Plans have been made to pipe water from Olive lake, west of the mine, to a point near the mill, which will give 1100 feet pressure. The power will be used for electric generation. This will supplement the present water power system by which the mill is operated. The Red Boy is the property of Godfrey & Taber.

The Little Giant, of which Chas. E. Balmforth is manager and S. G. Williams Supt., belongs to a Liverpool corporation. It is located near the head of Spring creek, which flows toward Clear creek. The property is provided with a number of buildings and a 20-stamp mill, with the machinery on the ground, but not set up. A tunnel has been driven about 1450 feet, in the course of which two ledges have been cut. On one of them 500 feet of drifting has been done and on the other 75 feet. Supt. Williams states that he expects to strike a third ledge within another 100 feet on the crosscut. There is some work also on an upper tunnel and in a shaft. The ledges cut range from 4 to 20 feet wide. The ores found are sulphides. Granite, July 24.

G. H. Roberts is arranging to have a dredger built for his placer mine on Crane creek, a tributary of the John Day, where prospecting shows ground averaging 90 cents a cubic yard.

#### JOSEPHINE COUNTY.

A. Watts, owner of the Watts placer mine, on Williams creek, near Grants Pass, states that the cleanup for the season was over \$1000 for each man employed. The mine has been worked for thirty years.

#### LINN COUNTY.

Thompson & Finn of Cottage Grove have bought a half interest in the Harlow & Stocks mines in the Bohemian district. The property has 700 feet of tunnels and a 5-stamp mill. The new company, of which Mr. Finn is president and Mr. Thompson secretary and treasurer, has incorporated the mines. Some process for treating the ores other than the stamp-mill process is desired, as the latter does not save over half the values.

#### SOUTH DAKOTA.

##### CUSTER COUNTY.

The University Co. of Vermillion has bought a group of claims near Custer. The property will be developed in connection with another property owned by the same company. At the latter a steam hoisting plant has been installed. The Gold Fish Co. of Des Moines, Iowa, is sinking a shaft on the Salmon mine. Work has been resumed at the Lizzie mine by the Willow Creek M. Co. of LeMars, Iowa. A new shaft is to be sunk.

On Spring creek, near Custer, the Copper Butte Co. of Chicago and New York has opened a nickel-bearing ledge showing, 80 feet down, an average of 2% nickel and from 2% to 6% copper.

A Belgian firm has bonded the Sally Cavanaugh tin mine at Oreville.

#### UTAH.

##### BOX ELDER COUNTY.

The Mineral Hill G. M. Co. has been incorporated, capital \$25,000. M. Rump is president and F. Riepen secretary, with office in Salt Lake City. The company owns the Mineral Hill Nos. 1 to 4 mining claims.

##### SEVIER COUNTY.

J. H. Wells and associates have leased the Blue Eagle group, at Joseph, to E. Williams for eighteen months, with an option of purchase at \$7000.

Wells, Bingsly & Hopkins are working their mine at Joseph and are taking out ore.

##### SALT LAKE COUNTY.

The Tintic M. & D. Co. is said to be considering the preliminary plans of a pyritic smelter for ores from the Yampa mine at Bingham and ores from its Tintic properties. The plant as outlined is substantially the same as operated by the Bingham C. & G. M. Co., but will include converters, to produce bullion containing copper, gold and silver.

##### UTAH COUNTY.

Moore Bros. and W. B. Searle of Provo have bonded the Silver King mine for two years and expect to sink 200 feet of shaft. A royalty of 15% on ores extracted is to be paid and \$36,000 for the property.

##### WAYNE COUNTY.

The Wayne County C. M. Co. has been incorporated, capital \$30,000. E. D. Woodruff is president and D. M. Lindsay secre-

tary, with office at Salt Lake City. The company owns the Enterprise Nos. 1 to 12 mining claims.

#### WASHINGTON. FERRY COUNTY.

It is reported that Tacoma people are interested in a project to build a smelter at the mouth of Kettle river, on the line of the proposed railroad to Republic.

#### FOREIGN.

##### BRITISH COLUMBIA.

(Special Correspondence).—The Prospectors' Exchange of Nelson reports that a contract has been let to drive a 200-foot tunnel on the Commonwealth ledge, Crawford Bay district, and it is expected to so develop the property that regular shipments will be made. The Nelson smelter is now treating about 140 tons of Silver King ore per day. About ninety men are working at the Rambler mine, Slovan district; the force will shortly be increased and the shipments enlarged. At a meeting to be held by the Rambler M. Co., on the 25th of this month, one of the important subjects to be discussed will be the erection of a concentrator. A small force of men are employed on the Lavina group, Lardo district. About 1700 feet of work has been done on this property. The pay streak is 1 foot wide and carries silver-lead ore that gives values of \$100 per ton. The company expects to ship about 2000 tons of high-grade ore this season. The Camborne group on Fish river, Lardo district, has been bonded by A. F. Rosenberger for the Rosenberger syndicate. A cash payment of \$4000 was made. This property is said to possess the finest surface showing in the new camp. A force of 120 men are employed at the Slovan Star mine and mill. Shipments amounting to 186 tons were made last week. Nelson, July 23.

It is estimated that the total cleanup in Atlin this season will be \$750,000. More than half of this amount will come from the hydraulic mines on Pine creek.

The English syndicate of which Lord Ernest Hamilton is promoter has bought all the claims on McKee creek, Atlin, for \$120,000, and will clean up about \$60,000 this season.

The total cleanup of the Willow creek claims, Atlin, owned by T. Dunn and R. B. Skinner of Vancouver, will be about \$100,000.

The Burlington Co., operating the Iron Horse mine, near Sandon, is figuring on a steam hoisting and compressor plant with which to continue sinking the shaft.

The controlling interest in the Texada mine, Texada island, has been purchased by a company of which G. H. Walters of Spokane, Wash., is a member. The purchase price is reported to be about \$400,000. The Texada mine is a gold proposition.

#### Obituary.

FRANK A. REYNOLDS, mining engineer, died suddenly at Santa Fe, New Mexico, on the 29th ult., aged 46 years. He was a native of Placerville, California, growing up in the mines naturally into the profession that became his life work. Well and favorably known, he was identified with the early history and development of many of the great mining districts of the West, notably Tombstone, Ariz., and Cripple Creek, Colo.

JAMES E. MILLS, a noted geologist, died at San Fernando, Sinaloa, Mexico, on July 25, aged 67 years. For many years he had been connected with the mining enterprises of the elder Agassiz and of his son, Alexander Agassiz. In Plumas county, California, he was for many years in charge of extended placer mining operations for them, in the conduct of which he personally made extended surveys of the geology of the northern section of the Sierra Nevada mountains, preparing many maps and an extended monograph (unpublished). He published several short discussions on the same subject. At the date of his death, and for several years preceding it, he has been in charge of the development of two large and important Mexican gold-copper mines for Alexander Agassiz and his associates in the Calumet & Hecla mine. Deceased was a man of a kindly, lovable character, endeared by the association of many years to friends, who feel keenly their loss in his unexpected death.

#### Books Received.

THE A. Lietz Co. of San Francisco, Cal., has issued the fourth edition of the "Manual of Modern Surveying Instruments." The manual, aside from the catalogue and price list of surveying and scientific instruments, offers to engineers a compendium of useful technical information concerning the construction, care of and uses of these instruments. In illustration, text and matter it is an at-

tractive, useful reference volume for engineers and surveyors. Published by the A. Lietz Co., 422 Sacramento St., San Francisco, Cal. Price 50 cents.

#### Personal.

H. M. LAMB of Victoria, B. C., is in San Francisco, Cal.

G. W. STOKES, Supt. Phoenix mine, near Phoenix, Ariz., is in New York.

ROBERT DE LARGE is now Supt. Crown Point mine and mill, Crown Point, Ariz.

F. A. RICHMOND of New York is at Ely, Nevada, examining mines at that place.

COLIN MUNRO has resigned the superintendency of the Vivandiere mine at Turret, Colo.

HERBERT STRICKLAND is now Supt. Spearfish G. M. & Reduction Co. cyanide mill, Preston, S. D.

W. B. GESTER, M. E., has returned from Mexico and is engaged in professional work at Stella, Cal.

R. W. GORRILL, who has been examining petroleum deposits in Mexico, has returned to San Francisco, Cal.

NOBLE W. JONES, of Salt Lake City, Utah, is now assayer for the Dexter-Tuscarora Con. G. M. Co., Tuscarora, Nevada.

J. O. JONES, formerly of La Porte, Cal., has recently returned to San Francisco from a year's absence in Siberia examining mines.

DR. H. PAULI AND F. R. PIELER of Johannesburg, Transvaal, are examining methods of ore reduction in Utah and Montana mines.

H. H. NICHOLSON, consulting engineer American Mining Investment Co., Denver, Colo., is examining copper properties in Chihuahua, Mexico, for Boston men.

S. A. PARNALL has resigned as Supt. Old Dominion Copper Co., at Globe, Ariz., and has accepted the same position at the Manzanero copper mines, near Cananea, Sonora, Mexico.

ARTHUR V. CORRY, assayer and chemist Dexter-Tuscarora Cons. G. M. Co., Tuscarora, Nevada, has resigned to take charge of the Mont d'Or mine, in the Butte district, Montana.

G. I. PEABODY of Philadelphia, Pa., is in Oroville, Cal., examining methods of gold dredger operations. He is connected with gold dredging operations on the Atrato river, Colombia, South America.

#### Commercial Paragraphs.

JOHN HARRIGAN has removed his assay office from No. 10 to No. 19 Stevenson St., San Francisco, Cal.

"OLD scrap steel going to waste, now used by the newly invented process, mining and other tools made into shape, cast just as heretofore forged, cast ready for use, can be used up, then welded, forged and used again," says W. J. Wilson, who placed the Pittsburgh plant for the United States Steel Co., and who says he is looking for a location on the Pacific coast.

ALVIN PHILLIPS & Co., Denver, Colo., report the receipt of ores at their Denver ore-testing works from many and widely divergent points in the Western States, Mexico and Alaska. These works have been gradually enlarged and now include gas furnace for melting and refining bullion, equipment for cyanide, chlorination and concentration work; a reverberatory furnace and roll-jaw crusher and centrifugal rolls. Bartlett, Wilfey and Sperry concentrators are in use there.

AN entirely new electric generating power plant will be placed at Ouray, Colo., by the Revenue Tunnel Mines Co. A. E. Reynolds president, H. W. Reed general manager, to consist of two cross compound Reynolds direct connected condensing Corliss engines, with three 250 H. P. internal furnace marine type boilers, steam pressure 160 pounds. The generators will be made by the General Electric Co. The order for the engines, boilers and condensing apparatus was placed last week with the Denver office of the Allis-Chalmers Co. The power will be transmitted to the Revenue Tunnel mines across the mountain 12 miles from Ouray.

#### Latest Market Reports.

SAN FRANCISCO, Aug. 1, 1901.

SILVER.—Per oz., Troy: London, 26 1/2 d (standard ounce, 925 fine); New York, bar silver, 58 3/4 (1000 fine); San Francisco, 58 3/4; Mexican dollars, 47 1/2 San Francisco, 46c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62 1/2; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: \$67 10s per ton.

LEAD.—New York, \$4.37 1/2; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5 1/2c 1000 to 4000 lbs.; pipe 6, sheet 6 1/2, bar 5 1/2; pig, \$5.25. London, \$11 15s per ton = 2.54 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, \$16 2s 6d per ton = 3.58 1/2 cts. per lb; San Francisco, ton lots, 5 1/2c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$25; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$27.50; San Francisco, ton lots, 30c; 1000 lbs., 30 1/2c; 500 lbs., 30 1/2c; less, 31c; bar tin, \$3 1/2, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, \$9 2s 6d; San Francisco, local, \$47.00 \$3 flask of 76 1/2 lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 \$3 lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5 1/2c; slab, 5 1/2c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15 1/2c.

PHOSPHORUS.—F. o. b. New York 50@60c \$3 lb.

ASSAY LITHARGE.—San Francisco, 10c \$3 lb., small lots.

BISMUTH.—New York, \$3 lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 \$3 lb. lots.

PLATINUM.—San Francisco, crude, \$19 \$3 oz.; New York, \$20.50 per Troy oz. FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

TUNGSTEN.—New York, \$3 lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c \$3 lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 1/2c; less than one ton, 17 1/2c. No. 1\*, 60%, carload lots, 13 1/2c; less than one ton, 15 1/2c. No. 1\*\* 50%, carload lots, 11 1/2c; less than one ton, 13 1/2c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9 1/2c; less than one ton, 11 1/2c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 9 1/2c \$3 set; 14 oz., 40s., 8 1/2c.

OILS.—Linsed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14 1/2c; do., cs., 20 1/2c; 86° Gasoline, bulk, 20c; do., cs., 26c; 65° Naphtha or Benzine, deodorized, in bulk, per gal., 13 1/2c; do., in cs., 19 1/2c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's' bbls., 60c; cs., 65c; No. 1 bbl., 50@52 1/2c; cs., 55@57 1/2c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32 1/2@33 1/2c \$3 lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c \$3 lb.; soda ash, \$1.90 \$3 100 lbs.; hyposulphite of soda, 2 1/2@3c \$3 lb.; blue vitriol, 5 1/2@6 1/2c \$3 lb.; borax, concentrated, 7@8c \$3 lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2 1/2@2 1/2c; California refined, 1 1/2@2c; nitric acid, in carboys, 8c \$3 lb.; caustic soda, in drums, 3@4c \$3 lb.; Cal. s. soda, bbls., \$1.00; ska, 95c \$3 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

## P & B Roofing for Hot Weather

"Low price" is a mighty poor reason for using a ready roofing, for the things which make it low in price are the things that make it poor in quality and ineffective for good work.

There is no roofing so good for a building as P & B Ready Roofing. In fact, it is the cheapest roofing, for it lasts the longest time without need of repairs.

P & B Ready Roofing will withstand the intense heat of the summer's sun and go through the winter's heaviest storms, and show up in the spring as good as the day it was laid. It is better than tin, iron, shingles, tar and slate, because they have all been tried and found faulty. P & B Ready Roofing has proven its worthiness for 16 years.

Send for booklet—address Dept. A.

**Paraffine Paint Co., 116 Battery St., S. F.**

## WOODBURY'S SIDE SHAKE CONCENTRATOR.

THIS Concentrator is superior to any other Belt Machine. It has an iron frame, steel shaking frame, and built in the most thorough manner. The patent distributing device distributes the pulp evenly over the whole working surface of the belt; thereby it enables the machine to perform perfect work, and giving more capacity to the Concentrator than any other Belt Machine. The variable eccentric crank gives the machine greater capability to work different classes of ore. I will warrant this machine as having more capacity than any other Concentrator.

Simple in Its Construction - Saves Fine Sulphurets -  
Without Loss in Tailings  
- Makes High Product - Capacity from 5 Stamps

Send for Catalogue. **GEORGE E. WOODBURY, 223 FIRST ST., SAN FRANCISCO, CAL. 'Phone Main 1766.**

## PATENTS

**DEWEY, STRONG & CO., San Francisco, Cal., and Washington, D. C.**

We are prepared to transact business with our clients direct from either our San Francisco or our Washington office. We have representatives in every country in the world having patent laws. The information accumulated through long and careful practice before the Patent Office and the frequent examinations of patents already granted, for the purpose of determining the patentability of inventions submitted to us, enables us to advise inventors, often saving them the expense of applying for a patent upon inventions which are not new. All worthy inventions patented through us are described in the *Mining and Scientific Press*. Guide to inventors sent on application. Address

Freight carrying capacity of wagons,  
16 TONS EACH,  
or a lot 1 capacity of train,  
48 TONS.

CAPACITY  
OF  
ENGINE,  
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.  
Estimates made for complete Steam Freighting Outfits. Address

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cid., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

Is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

## ASSESSMENT NOTICES.

**CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1901, an assessment (No. 19) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2d day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

B. N. SHOECRAFT, Secretary.

Office—113 Crocker Building, San Francisco, California.

**EUREKA CONSOLIDATED DRIFT MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1901, an assessment (No. 31) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, room 31, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2d day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—214 Pine street, room 31, San Francisco, California.

**THE BUTTE BASIN GRAVEL MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23rd day of July, 1901, an assessment (No. 3) of One Cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at his office, 35 Steuart street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23rd day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

O. E. HOLMES, Secretary.

Office—No. 35 Steuart street, San Francisco, California.

## DELINQUENT SALE NOTICE.

**YUBA CONSOLIDATED GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 22nd day of June, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

| Names.         | No. | Cert. | No. | Shares. | Amt.    |
|----------------|-----|-------|-----|---------|---------|
| John Finn..... | 23  | 500   |     |         | \$15 00 |

And in accordance with law, and an order from the Board of Directors, made on the 22nd day of June, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the secretary, at Room 801 of the Claus Spreckels Building, corner of Third and Market Streets, San Francisco, California, on MONDAY, the 19th day of August, 1901, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

EDWARD H. STEARNS, Secretary.

Office—Room 801, Claus Spreckels Building, San Francisco, California.

## ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the AMERICAN OIL AND REFINERY COMPANY will be held at the company's offices, Rooms 322-323 Parrott Building, 825 to 855 Market St., in the City and County of San Francisco, on MONDAY, the 19th day of August, 1901, at 1:30 P. M., for the election of directors for the ensuing year and the transaction of such other business as may properly come before the meeting.

J. C. ANTHONY, Secretary.

# 200,000 H. P.

## DEVELOPED BY

# Pelton Wheels

OPERATING

ELECTRIC TRANSMISSION PLANTS ALONE.

## SENSITIVE REGULATION.

SEND FOR ILLUSTRATED CATALOGUE.

THE PELTON WATER WHEEL CO.,

127 MAIN ST., SAN FRANCISCO, CAL.

143 LIBERTY ST., NEW YORK, N. Y.

## KNIGHT'S WATER WHEEL.

The accompanying cut shows the general arrangement of The Knight Water Wheel, direct-coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing. These wheels are designed for 100 to 2500 H. P. Highest efficiency and regulation guaranteed.

WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING. Wheels for mill and reversible hoisting works a specialty.

**KNIGHT & CO., Sutter Creek, Cal.**

For full particulars, send for descriptive catalogue.

## THE McCORMICK TURBINE.

### FEATURES WORTH CONSIDERATION:

Great Capacity, High Speed, Unequaled Efficiency,  
Steady Motion, Easy Working Gate,  
Greatest Power from a Limited Quantity of Water, at Smallest Cost.

UNDOUBTEDLY THE MOST POPULAR TURBINE MANUFACTURED.

WRITE FOR CATALOGUE.

**S. MORGAN SMITH COMPANY,**  
YORK, PA., U. S. A.

## THE HUG WATER WHEEL

has a guaranteed **EFFICIENCY OF 86%**, as shown by Test Curves from Cornell University.

**Most Economical Wheel on the Market.**

**No Loose Buckets Possible.**

**Manufactured by D. HUG,**  
Denver, Colo., U. S. A.

## VULCAN DOUBLE ROPE TRAMWAYS.

### VULCAN ROPEWAYS (SINGLE ROPE SYSTEM).

#### AUTOMATIC LOADING AND DUMPING APPLIANCES

AND  
OTHER  
ROPE  
HAULAGE  
SYSTEMS.

SEND  
FOR  
CATA-  
LOGUE.

**Vulcan Iron Works,** Manufacturers of **SAN FRANCISCO,**  
Mining Machinery, **CALIFORNIA.**

## TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

**3 Feet to 2000 Feet.**

Our experience of 38 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

State your Head and requirements. Send for pamphlet.

**JAMES LEFFEL & CO.**  
SPRINGFIELD, OHIO, U.S.A.

## Joshua Hendy Machine Works,

Nos. 38 to 44 Fremont St., San Francisco, Cal.

## THE JEANESVILLE Miners' Sinking Pump

### HAS THE FOLLOWING ADVANTAGES:

It is designed especially for the roughest and most exacting service.

It is particularly adapted for gritty water.

It is very strongly and yet compactly built, so as to occupy as small a space as possible.

It can be operated in any desired position, either vertical or horizontal.

This pump is an improvement in many ways over other makes of sinking pumps.

The cap under the Plunger is fastened with Hinge Bolts, one bolt retaining the cap after the rest are released. Also providing Priming Valves in the Water Valve Chest Cover to prime the Lower Valves from Column Pipe, and they are so close as to be in no danger of breaking off.

We have thickened, and thereby strengthened, the wall of water passage leading from lower end of plunger. We have also strengthened the form, without adding materially to the weight of the connecting piece opposite the water passage. These have been weak points in other sinkers.

All parts commonly made of brass, such as water valve seats, valve stems, valve springs, etc., are made of Phosphor Bronze.

All parts are made to gauge, so that they can be easily renewed.

Parts for repairs will interchange with Cameron Sinkers of the same size.

## MORAN FLEXIBLE JOINTS.

Simple. Efficient. Durable.

All Metal Construction.

Positively Tight Under Any Pressure.

Applicable to Steam, Air, Water, Oil.

## PROFESSIONAL CARDS.

**R. H. POSTLETHWAITE, M.I.E.E.**  
**Hydraulic Mining Engineer.**  
 River Dredging for Gold a Specialty.

 NOGALES, ARIZONA.

**LETSON BALLIET,**  
**Mining and Civil Engineer,**  
**Chemist and Metallurgist,**  
 508 California St., San Francisco, Cal.  
 Special attention to treatment of low grade and refractory ores by all chemical and mechanical processes.

**I. ELMER ROSE,**  
**ASSAYER**  
 GRANITE, - OREGON.  
 Amalgamation, Concentration and Cyanide Tests. Mines Examined, Ore Sampled, and Reports Made. Mines Bonded for Investors.

**LOUIS FALKENAU,**  
**STATE ASSAY OFFICE,**  
 536 Sacramento St., below Montgomery.  
 Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.  
 Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

**ABBOT A. HANKS,**  
**CHEMIST AND ASSAYER.**  
 Successor to Henry G. Hanks, est. 1886. The supervision of sampling of ores shipped to San Francisco a specialty.  
 -531-  
 California Street,  
 San Francisco.

**HOWARD E. BURTON,**  
**ASSAYER and CHEMIST,**  
 111 E. Fourth St., LEADVILLE, COLO.  
 Specimen prices: Gold, 50c; Gold & Silver, 75c; Gold, Silver & Lead, \$1; Gold, Silver & Copper, \$1.50; Silver or Lead, 35c; Copper or Zinc, \$1.  
 Mailing envelopes sent to any address.

**MINERS' ASSAY OFFICE.**  
**(JNO. HARRIGAN)**  
 19 Stevenson Street, - San Francisco, Cal.  
 Telephone Clay 972.  
 Assaying, Analyses, Sampling, Grinding and Pulverizing of all kinds.  
 Practical Working Tests of Ore by all Processes. Mining Machinery Bought and Sold. Check Assays. Instructions given in Assaying. All Work Guaranteed. Mines Examined. Sampled and Reported on by J. J. CUM MINGS, M. E. and Cyanide expert.

**J. W. RICHARDS,**  
 (Late of Aspen, Colo.)  
**ASSAYER and CHEMIST.** 1754 Champa Street,  
 DENVER, COLO.  
 Ore Shippers' Agent. Write for Terms.

**MANNING'S ASSAY OFFICE,**  
 Assaying in All Its Branches.  
 BOISE, IDAHO.

**RELIABLE ASSAYS.**  
 Gold, \$1.00; Silver, \$1.00; Lead, \$1.00; Copper, \$1.00; Zinc, \$1.00; Nickel, \$1.00; Tin, \$1.00; Platinum, \$1.00; Iron, \$1.00; Manganese, \$1.00; Potassium, \$1.00; Sodium, \$1.00; Magnesium, \$1.00; Calcium, \$1.00; Barium, \$1.00; Strontium, \$1.00; Bismuth, \$1.00; Antimony, \$1.00; Arsenic, \$1.00; Tellurium, \$1.00; Selenium, \$1.00; Iodine, \$1.00; Bromine, \$1.00; Chlorine, \$1.00; Fluorine, \$1.00; Oxygen, \$1.00; Hydrogen, \$1.00; Nitrogen, \$1.00; Carbon, \$1.00; Silicon, \$1.00; Phosphorus, \$1.00; Sulfur, \$1.00; Magnesium, \$1.00; Calcium, \$1.00; Barium, \$1.00; Strontium, \$1.00; Bismuth, \$1.00; Antimony, \$1.00; Arsenic, \$1.00; Tellurium, \$1.00; Selenium, \$1.00; Iodine, \$1.00; Bromine, \$1.00; Chlorine, \$1.00; Fluorine, \$1.00; Oxygen, \$1.00; Hydrogen, \$1.00; Nitrogen, \$1.00; Carbon, \$1.00; Silicon, \$1.00; Phosphorus, \$1.00; Sulfur, \$1.00; Magnesium, \$1.00; Calcium, \$1.00; Barium, \$1.00; Strontium, \$1.00; Bismuth, \$1.00; Antimony, \$1.00; Arsenic, \$1.00; Tellurium, \$1.00; Selenium, \$1.00; Iodine, \$1.00; Bromine, \$1.00; Chlorine, \$1.00; Fluorine, \$1.00; Oxygen, \$1.00; Hydrogen, \$1.00; Nitrogen, \$1.00; Carbon, \$1.00; Silicon, \$1.00; Phosphorus, \$1.00; Sulfur, \$1.00; Magnesium, \$1.00; Calcium, \$1.00; Barium, \$1.00; Strontium, \$1.00; Bismuth, \$1.00; Antimony, \$1.00; Arsenic, \$1.00; Tellurium, \$1.00; Selenium, \$1.00; Iodine, \$1.00; Bromine, \$1.00; Chlorine, \$1.00; Fluorine, \$1.00; Oxygen, \$1.00; Hydrogen, \$1.00; Nitrogen, \$1.00; Carbon, \$1.00; Silicon, \$1.00; Phosphorus, \$1.00; Sulfur, \$1.00; Magnesium, \$1.00; Calcium, \$1.00; Barium, \$1.00; Strontium, \$1.00; Bismuth, \$1.00; Antimony, \$1.00; Arsenic, \$1.00; Tellurium, \$1.00; Selenium, \$1.00; Iodine, \$1.00; Bromine, \$1.00; Chlorine, \$1.00; Fluorine, \$1.00; Oxygen, \$1.00; Hydrogen, \$1.00; Nitrogen, \$1.00; Carbon, \$1.00; Silicon, \$1.00; Phosphorus, \$1.00; Sulfur, \$1.00; Magnesium, \$1.00; Calcium, \$1.00; Barium, \$1.00; Strontium, \$1.00; Bismuth, \$1.00; Antimony, \$1.00; Arsenic, \$1.00; Tellurium, \$1.00; Selenium, \$1.00; Iodine, \$1.00; Bromine, \$1.00; Chlorine, \$1.00; Fluorine, \$1.00; Oxygen, \$1.00; Hydrogen, \$1.00; Nitrogen, \$1.00; Carbon, \$1.00; Silicon, \$1.00; Phosphorus, \$1.00; Sulfur, \$1.00; Magnesium, \$1.00; Calcium, \$1.00; Barium, \$1.00; Strontium, \$1.00; Bismuth, \$1.00; Antimony, \$1.00; Arsenic, \$1.00; Tellurium, \$1.00; Selenium, \$1.00; Iodine, \$1.00; Bromine, \$1.00; Chlorine, \$1.00; Fluorine, \$1.00; **Kendall's Patent  
Quartz Mills.**

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at Greatly Reduced Prices. Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

**Don't Take Chances**

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

**CYANIDE WORK**

and claim to have introduced the use of Cyanide to this Western country by the

**MACARTHUR-FORREST PATENT METHODS.**

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ¼ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

DENVER, COLO., U. S. A.

**THE SNODGRASS HAND POWER  
COMMON SENSE PULVERIZER & CONCENTRATOR.**

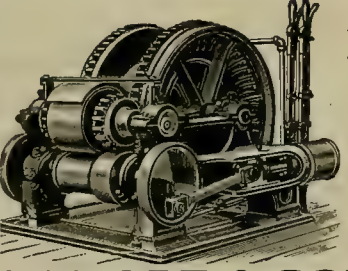

6' 0" 7' 3"

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1½ to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

## THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

## THE "JAMES" AUTOMATIC ORE FEEDER.

### THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.

" " " iron " - 1000 "

### ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

## Gold Mining in the Sea Bottom.

Alaska experience has made known many novel conditions and kinds of placer mining. Mining under moss, mining at the terminals of glaciers, burning one's way through perpetually frozen ground to the bedrock, getting out dumps in winter to be washed in summer, reversing the old California way of getting out dumps in summer for winter washing, were all novel placer mining experiences of the Klondike a very few years since. Later, with the discovery of gold at Nome, beach mining became in turn the novelty to attract popular attention.

The illustration on this page is of a still later placer mining novelty. The miners are boring through the ice in Behring sea, a quarter of a mile off the shore at Nome City, to prospect the bottom of the sea beneath. The photograph from which the illustration was made was taken on June 1st of this year. The time of year is itself a novelty for an exploration beneath the ice and gives some idea of the long period during which work of this kind is possible on the edge of the Arctic circle.

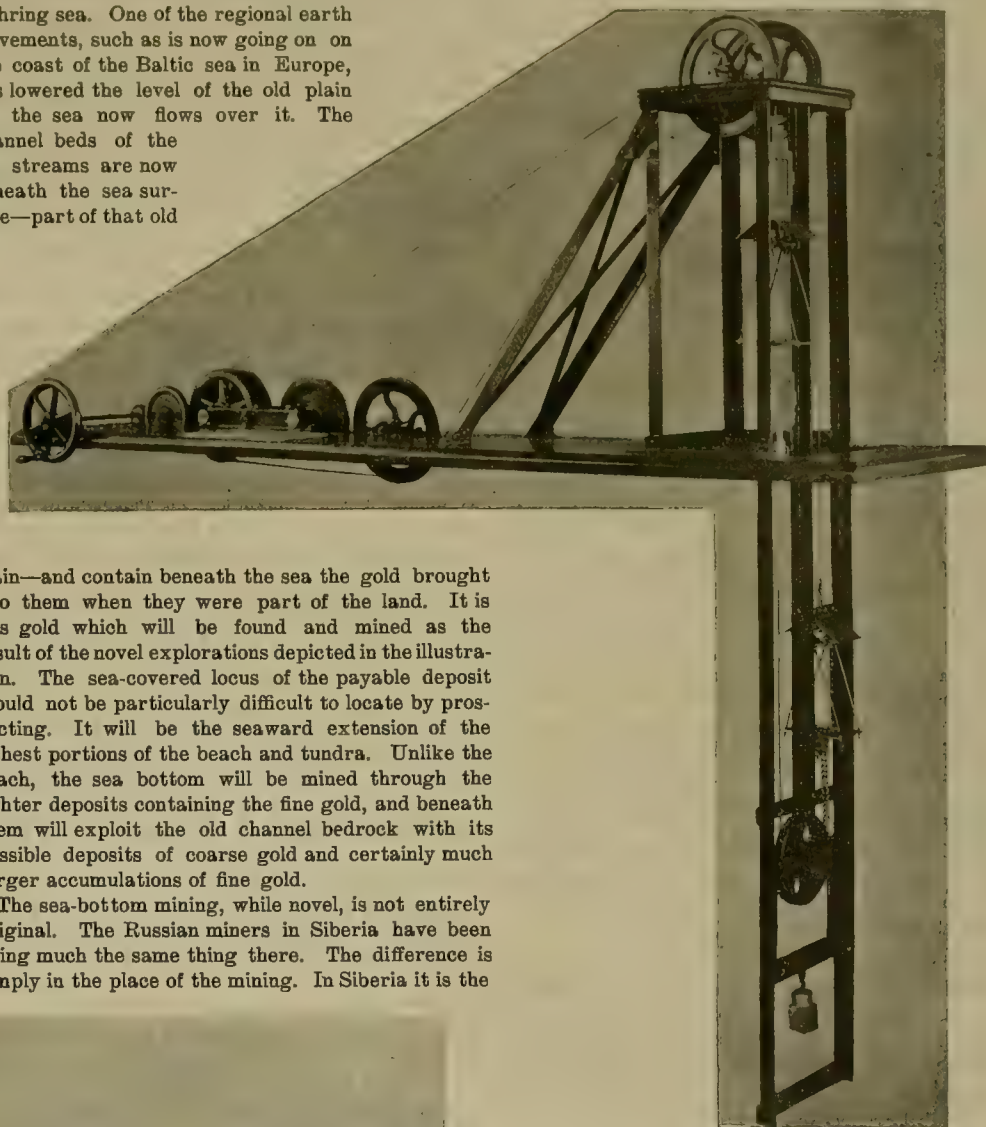

The beach at Nome is flat and beneath the sea slopes away so gently that at the quarter mile distance, where the boring—or, more exactly, shaft digging—in the ice is going on, the sea is still so shallow that it is solid ice to the bottom. Diving suits are not necessary. There is no water at the sea bottom to contend with.

Geologically, there is no reason why such explorations of the sea bottom at Nome—but not the sea bottom at any or every other place—should not develop payable placers. The stream whose old beds and channels have proven so rich in gold in the high lands back of Nome once had a comparatively direct line of flow from the high lands, through the tundra as it now is, and through a gently sloping valley, occupying an area now covered by the waters of

Behring sea. One of the regional earth movements, such as is now going on on the coast of the Baltic sea in Europe, has lowered the level of the old plain till the sea now flows over it. The channel beds of the old streams are now beneath the sea surface—part of that old

plain—and contain beneath the sea the gold brought into them when they were part of the land. It is this gold which will be found and mined as the result of the novel explorations depicted in the illustration. The sea-covered locus of the payable deposit should not be particularly difficult to locate by prospecting. It will be the seaward extension of the richest portions of the beach and tundra. Unlike the beach, the sea bottom will be mined through the lighter deposits containing the fine gold, and beneath them will exploit the old channel bedrock with its possible deposits of coarse gold and certainly much larger accumulations of fine gold.

The sea-bottom mining, while novel, is not entirely original. The Russian miners in Siberia have been doing much the same thing there. The difference is simply in the place of the mining. In Siberia it is the

Experimental Model for Electric Hoists for Comstock Mines.  
(See Page 55.)

Boring Through the Ice of Behring Sea, Nome City, Alaska, Prospecting for Gold.

stream beds that have been mined. The Russian miner's practice is to cut out from the ice the area he designs to make his shaft. This exposes a water surface. Poles are then forced vertically down on the sides of the shaft to the bottom of the stream. The water again freezes on the exposed surface and also freezes behind the poles. The freshly frozen ice is cut out and the ice formed behind the poles makes a wall, preventing the further influx of water. The miner then thaws the bottom of the stream bed with fire and removes to the stream banks what he wishes of it within the limits of his shaft. Later in summer he washes up his dump and recovers the gold.

This mining of the sea bottom through the ice can not fail to make some amendments to the law of placer locations in Alaska. The bottom of the sea is not public land of the United States. Neither when the sea is frozen can it be called navigable waters. Just how the dredger rights that were to be granted to work the sea bottom at Nome are going to be construed in connection with drifting beneath the ice is not clear. The admiralty cases do not furnish precedents for deciding titles to mining claims.

THE Canadian Government has made an order directing the payment of a rebate of 1% on Klondike gold delivered at the Dominion Assay Office at Vancouver when accompanied with the certificate showing that the royalty had been paid. The rebate will be very satisfactory to the Klondike miners and is the equivalent of making the royalty 4% in place of 5%. It is an aid to the industry of gold mining in the Klondike by giving it a wider profit margin.

A KANSAS assessor has announced a new method of determining the valuation of mines for assessment. He proposes that the mine owner should make a declaration of value and that the declaration should have the effect of an offer to sell at a figure 10% higher, any person being permitted to buy. The absurdity of this seriously presented proposition, even though it comes from Kansas, should emphasize the necessity for public enlightenment and comprehension of the true principles on which taxation of mines should be based.

WHILE the Government of the Dominion of Canada is reducing the royalty on the Yukon gold production, and generally aiming to reduce the incidental burdens on placer mining, the Government of the Province of British Columbia is doing the opposite of this in Atlin. The latest order requires the royalty tax to be paid on the first day of every month, instead of once every quarter. The change is a vexatious and costly one to mine owners, compelling them to lose time as well as money, as they are compelled by the order to report at Atlin every month, even if there is no production at all from their claims.

THE Selby Smelting and Refining Works, through which has passed in the nearly forty years of its establishment at San Francisco almost all the gold and silver production, not alone of California, but of the Pacific coast, suffered from a robbery of about \$280,000 on the morning of the 6th inst. The thieves tunneled from the outside of the works at Selby in Contra Costa county, Cal., and entered the bullion storeroom by cutting through the steel floor. The loss was in gold bullion, part refined and part stored pending the refining. The loss does not affect the solvency of the company and depositors of bullion lose nothing. The loss to the company is the first made by theft in its history, during which nearly one thousand millions of dollars worth of gold and silver have been melted and refined. Detectives are at work, and it is sincerely hoped that the stolen treasure may be recovered: \$25,000 reward is offered for apprehension and conviction of the thieves and recovery of the bullion. Meanwhile there is no cessation of business.

## Two Kinds of Miners' Unions.

At the present time demands are being made for a higher rate of wages for mine laborers employed as shovelers or muckers in some gold mines in New Zealand and in some gold mines in British Columbia.

In New Zealand the muckers in the gold mines of one of the districts are demanding an increase in their wages. They claim that they are underpaid for the work they do and justly should have more pay. Their employers claim the profit of gold mining is so small that it will not admit of the increase. The men have made their appeal to a permanent Board organized by law, in which each party is represented equally by men of its own choosing. The workmen have a union, membership in it not being a matter of election by existing members, but by the free choice of the workman himself. The workman is a member practically by reason of doing that particular class of work. There are other unions of laborers in the other branches of mining labor. There has been no strike, no offer to strike, and no discharge of complaining laborers by employers. The other labor unions have not interfered. It is only the affair of the men directly interested. The permanent Board is hearing both sides. Its decision will be binding, unless an appeal be taken by either party to another Board for cause. Such appeal is rarely taken. The rate of wages when fixed by the Board continues in force for at least two years. All of this procedure is the orderly operation of law. It is the action of all the people in the country recognizing its organized society interest in the welfare and business, not of one individual or class, but of all individuals and all classes. The State itself is economically a labor union, and the State gives, in fact, to each individual the equity that it guarantees in theory.

In British Columbia at Rossland the men who work as muckers are demanding an increase in wages. They have a union in which membership is a matter of election by the members already organized. Other laborers to whom they refuse election to the union are not permitted—by force, if necessary—to work at that occupation. There are other unions of mine workers organized on the same principle. Refused the increase in wages, the appeal is made to the other unions. All have struck, and, refusing to work themselves, refuse to permit others to work in their places. Organized society—the State—has no legal procedure by which it can adjudicate the difference conclusively. It has no procedure for preventing the industrial disorganization consequent on a strike. It has no power protecting the owners of mines in their use against the physical power of labor unions.

Both New Zealand and British Columbia are British colonies. Each is in the control of its local affairs more paramount than any State of the United States. In both the political power of the labor union is paramount. But the labor unions are not the same in the two Provinces. In New Zealand the labor union is a union of all employers and all who labor. It is the State. It is responsible. If labor has an equitable right to reasonable wages and maintenance of employment, so, too, has the employer an equitable right to the conditions which permit fair wages and continuous work. Neither is permitted to injure the other, and the real facts control findings, regardless of who may be sustained in the special contention. On the other hand, while in British Columbia the political power of the labor union is paramount, the power is exercised by a self-elected faction of the people, and represents what they consider their personal policy, regardless of the equities of those not of their labor union faction. The labor union is not a union of all employers and all men who labor. It is a union of a self-elected portion of the men who labor. It has as an organization no place in law. It is wholly irresponsible.

Broadly speaking, the New Zealand idea of labor union is constructive of society; the British Columbia idea is destructive of society. The difference starts with the difference between responsibility and irresponsibility. The difference in the two countries to the men and society, the State, or the public, as a result of the difference of method employed by workmen doing the same kind of work, and making the same demand of their employers, is measured by an enormous sum of productive energy.

In New Zealand no laborer stops working, no employer is permitted to stop working, pending a

determination of the facts. Both parties meet equally before the law and are equally bound by its judgment. If the laborer is given what he asks, he is bound to accept it for a definite time. There is no loss of productive energy anywhere. There is only a more equitable distribution of its production. Every man has a right to work and is insured a just wage for his labor. The employer is not restricted in the use, enjoyment or reproductive power of his capital.

In British Columbia every laborer stops working, not alone those who consider they have a grievance, but every laborer in other branches of the same trade, and laborers in other trades as well, entirely independent of any direct material interest in the difference. The employers are stopped by force from working. Neither party is before the law. There are no judgments. If the laborer is given what he asks, he is not bound to continue accepting it for any period of time at all. There is the loss of the productive energy of an entire community, or it may be several communities, till the difference is adjusted. Every man does not have a right to work. No man is insured just wages for his labor. The employer is restricted in the use, enjoyment and reproductive power of his capital.

New Zealand shows what responsible, lawful labor union does for the laborer and for society. British Columbia shows what irresponsible, unlawful labor union does for the laborer and for society. The details of how New Zealand does it are not essential. The essential element is responsibility.

## Bad Mine Management.

The incidence of explanation for many mining operations which are discontinued before they become profit-earning is put on that ancient scapegoat "bad management." It is easily applied as an excuse, is not readily controverted by facts, and contributes best to the chance of passing the cost of failure on to others. It is always the most satisfactory to the local interests where the mine is situated, on the ground that it does not operate to prevent the revival of the mining operation.

That good mines always make good mine managers is a proposition not usually questioned. Nevertheless it is disputable. Very good mines do pay under very bad and wasteful management. In fact, such mines are the ones everyone wants. To the suggestion that a certain mine would pay with good management, one of the old mine operators is quoted as saying: "That the kind of a mine he wanted was one that did not have to have good management, but would pay with bad management."

In fairness to mine managers and superintendents, who are as a class, men of exceptional ability and special qualification for their business, the charge of bad management should be used far more discriminately than it is. Mineral deposits must be explored and tested before it can be known if they are commercially exploitable. Mine managers and superintendents have to be in charge of such work. It is safe to say that they use the best judgment that can be made on facts as they appear, and plan intelligently for the ultimate end. The critic who condemns the result, or manner of operating toward it, without being as advised at the beginning as was the mine manager, is illogical and unjust.

All mining work, even exploratory, must be accomplished as part of a plan. The avoidance of waste is a consideration of the first importance. Other conditions being equal, the plans of exploration or prospecting should be such that the work performed and expenditure made, can, subsequently, if the prospecting be satisfactory, become part of the ultimate scheme of exploitation. Yet it is just this kind of intelligent planning that meets with the most severe criticism of the uninformed and unthinking as being bad management, in case the operation is abandoned. Actually, however, such planned work, seemingly a waste, is in reality an economy. It demonstrates that the particular mineral deposit is not a mine the more conclusively and at a minimum of cost.

It is always safe to question the charge of bad management of a mine as the cause of its failure. The mere assertion should not be accepted as its own proof. If the question is material, examine the real facts from the beginning and form conclusions from them. Bad mine management is more often a scapegoat than a cause.

## Concentrates.

IN a locomotive's firebox 175 gallons oil are equivalent to a ton bituminous coal.

GOLD in clear quartz crystal is not uncommon; native silver in the same matrix is quite rare.

THE load on a belt transmission remaining constant, substituting a wider belt will not operate to prevent slipping.

WOLFRAMITE carrying 60% tungstic acid with favorable mining and freight conditions might warrant development. The demand is limited, practically none, locally.

A NET FALL of 400 feet to the mile will provide power to operate a suspended cable transportation plant by gravity. Where the fall is less, auxiliary power in proportion is required for proper operation.

LARGE fine crystals of any rare mineral and of many minerals that are not uncommon have a commercial value as specimens for mineral cabinets. The demand is generally in excess of the supply offering.

THE bulletin on the cyanide process, issued by the California State Mining Bureau, can be obtained by application to the State Mineralogist, San Francisco, remitting price (39 cents), which includes postage.

THE work required to compress one pound of air adiabatically from atmospheric pressure and 60° temperature to ninety pounds pressure is about one and one-third times as much as to compress it isothermally.

AVERAGE practice with direct-acting steam power pumps in large installations can be safely estimated on to require the consumption of 16.67 pounds of bituminous coal for every 1336 cubic feet of water lifted one foot.

THE waste dumps taken out in making the first mine openings can be used for filling the voids made later in exploiting the ore bodies. In some instances quite an economy of cost of timbering is effected by their use.

WHERE mine waters contain even small percentages of sulphate of copper, iron pipes and iron pump cylinders and fittings are rapidly corroded. Hoisting the mine water in buckets is under such conditions usually most economical.

A LIZARD is a rough form of sled used with animals to move ore down hill over trails not practicable for wagons or carts. It is a tree fork covered with a pole or plank bed to hold sacked ore. It is, under the conditions used, cheaper than packing.

By the use of portable jackets and clamps, thermite, the form of aluminum employed in welding, may be employed to weld the joints of water or steam pipes after they have been put in position. The joints made by the welds are as strong as other portions of the pipe.

NOVACULITE is the name of a variety of sandstone rock, extensively developed in Arkansas, which is used largely as the material from which whetstones, oilstones and small grinding wheels are made. It is a very dense, fine-grained stone, composed of nearly pure silica.

SPECIMEN GOLD can be cleaned of rust by boiling in dilute nitric acid. What is known as rusty or coated gold is commercially cleaned of the rust sufficiently to amalgamate by grinding in pans. Some of this latter class of gold can only be recovered by concentration with the sulphurets.

IN cleaning the object glass of a telescope it should not be rubbed in the cleaning. Dust should be brushed off with a camel's-hair brush and the glass should then be lightly and carefully wiped with a clean piece of chamois leather. If very dirty, wash with alcohol, water and soft chalk which contains no grit.

THE grade or fall of sluice boxes varies from a minimum fall of 2½ inches to a 12-foot box to 12 inches, or even 14 inches, to that length. Ten inches fall is common practice with large sluices and large heads of water. The very low heads are never desirable and are only used where there is a scarcity of dump fall.

A CHANGE in the voltage under which a long distance electric transmission is made will make an opposite change in the percentage of loss of the current transmitted. The current at the generator being constant, an increase in the voltage decreases the line loss of transmission, and a decrease in the voltage increases the line loss of transmission.

HEADS of water up to 1700 feet are in use or planned for use with tangential water wheels in electric power plants. The very high heads are not desirable, particularly in large installations, on account of the excessive quantities of structural material necessary to insure safety. A head of water of about 600 feet is regarded as more desirable and economical with large units than higher heads.

THE best way to find the average weight of ore or waste in a mine carload is to weigh a stock pile of twenty-five to forty tons. Let the mine car man fill his cars from this, keeping a record of the number. A division then gives an average weight that can be used with the mine run of output. The suggested method, though somewhat more trouble than weighing occasional carloads, is more accurate.

THEORETICALLY, the loss of energy from the heating of the air during compression made adiabatically is—the

initial temperature being 60° Fahr. and gauge pressure 110 pounds—about 38% for a single-stage compressor, 17% with two-stage and 5% with four-stage compressor. With a gauge pressure of 2000 pounds, single-stage compression makes a loss of 121%, double-stage 45% and four-stage 20%.

THE government of the quantity of water discharged on a water wheel under high heads or from long pipe lines cannot safely be effected by changing the flow in the pipe line. The only safe methods are by shifting the stream on or off of the wheel by a deflecting nozzle or by a combination which, while it throttles the stream passing through the nozzle, opens a by-pass discharging the water cut off from passage through the nozzle. The first described method is in practical use.

COKE CONCRETE employed for special constructions can be made by specifications as follows: The mixture consists of four parts of coke by measure broken to pass 1½-inch mesh and be retained by ½-inch mesh; two measures of coke screened through a ½-inch mesh, but retained by a ¼-inch mesh; and one measure of cement. Coke to be of best quality furnace coke—hard, free from dust and dirt and thoroughly saturated with water before mixing. The mixing is effected in the ordinary manner.

SOME waste of gold, or rather some unrecovered gold in stamp mill operation, may be an actual economy of cost. Assuming for example that a finer crushing makes a higher percentage of saving, the amount of that additional recovery to the ton must be measured, not only against the added cost of milling per ton by reason of fewer tons treated, but must offset an added amount based on the general operative costs of the mining as well. Decreased tonnage milled increases mining costs as well as mill charges per ton.

SPRINGING A HOLE in blasting consists in shooting the bottom of the hole with a light charge of powder to enlarge it so that it will take the main charge of powder close at the bottom of the hole and accomplish more breaking effect. From one-half a stick to two sticks of ½-inch powder are used in springing. The cap and fuse are tied into the cartridge, into which the light springing charges are made, placed in the bottom of the hole, and exploded either with a light tamping cover or none at all. Sometimes a second springing is given before loading to break.

DIAMONDS are found in three widely separated districts in the United States. In no one of them has there yet been a development of quantity sufficient to make a commercially exploitable mine. In California diamonds have been found in Butte, El Dorado and Calaveras counties in the Sierra Nevada watersheds of the Sacramento and San Joaquin rivers. In Georgia, North Carolina, Tennessee, Kentucky, Alabama and South Carolina diamonds have been found at a number of points in the Appalachian mountains. In Wisconsin, Michigan, Indiana and Ohio, in the vicinity of what is described by the U. S. Geologic Survey as the Green Bay lobe of the continental glacier.

THE ordinary form of T rail used in metal mines is not the best form for that purpose. The defect is in the distribution of the metal. The web is deeper than necessary and the tread narrower. The narrow tread cuts car wheels rapidly, shortening their life. For this reason a sixteen-pound-to-the-yard rail is sometimes used to get a wider tread and save in the cost of replacing car wheels where a twelve-pound-to-the-yard rail would otherwise answer. The T rail form and weight that would most generally answer requirements would have a tread slightly wider than the sixteen pounds of the ordinary type, and a short web, and would weigh about fourteen pounds to the yard.

THE bars of gold-bearing streams are frequently noted as having a successive annual renewal of the deposit of placer gold, in amount occasionally sufficient to pay for working. This gold is invariably fine float gold and is left on the surface of the bar by the receding flood-water flow. It is largely, in California, the fine gold which passes the sluices and hydraulic mines higher up stream. While, as noted, frequently sufficient in amount to pay for working, it will only pay for very limited operation by rocker or sluice. The gold is on or close to the surface only and the pay deposits of a bar rarely has much superficial extent. It is not safe to conclude from pay results from rocker work that dredging will be profitable.

THE time a shift is allowed to load its holes, remove tools from the face, and shoot, varies between limits of twenty to thirty minutes. Where in the count of shots it appears that one or more have missed it should be the duty of the shift doing the shooting to investigate and shoot any missed holes. A record should be kept of the holes shot and of missed holes. The fuse and cap of the latter should be examined for the cause. If the record shows the cause of missed holes to be in imperfect fuse or caps, the lot should be rejected and a fresh lot obtained. There is no economy, and very much danger, involved in the use of explosives that do not surely explode at the first trial.

A NEEDLE of a surveyor's compass that has lost its magnetism may be charged with an ordinary horseshoe magnet, one of 3 inches in length being sufficient. Hold the horseshoe magnet with the poles upward. Pass each pole of the needle from center to extremity over the opposite pole of the magnet, describing before each

pass a circle of diameter about double the length of the needle. Use a rather light pressure. In making the successive passes care should be taken not to return it in a path near the pole. Charging changes the balance of the needle. The balance is adjusted by shifting the brass wire on the south end.

LOSSES by seepage and evaporation from ditches distributing water for mining or irrigation are affected by so many special local circumstances and conditions that any general rule is subject to qualification. Tests made in summer in the Sierra Nevada mountains in California, measuring the water entering the main ditch at its head gate, and measuring the several heads distributed at the outlets, the total length of ditches being about 100 miles, showed an aggregate of losses of 30% of the total. The loss is more in small ditches than in large ones, and more in slow-flowing water than in rapid-flowing. In the tests made the conclusion was that two-thirds of the loss was due to seepage and one-third to evaporation.

A SMALL expense incurred in the surface arrangement of the waste dumps from mines carrying copper with considerable disseminated pyrite may in some cases be made to return a material profit. The waste containing less than 1%, or even as low as one-half of 1%, of copper, if dumped so as to permit free access of air and the convenient collection of water leaching through it, will yield up some of its copper in the form of cement copper. With a large tonnage in dumps a very few pounds of copper yield to a ton will produce a considerable sum. The expense of arrangement of the waste and the provision for precipitating plant should not exceed a few cents per ton, and be well within the minimum returns that can be estimated.

THE determination of the nature of unexpected minerals appearing in making assays is hardly practicable at long range. When such a mineral develops, particularly where it may affect the accuracy of the assay, the first step is to apply the methods of qualitative analysis. Get the mineral into solution by treating with acid, then apply the simple eliminating tests, which in the end will determine it absolutely. The knowledge of qualitative analysis required should be part of the education of an assayer. The black mineral found in with the gold on parting the assay button of rich silver-bearing rock is probably antimony. If the ore originally contained any considerable amount, and any of it was carried on into the button, the parting from the silver would leave it with the gold.

THE Civil Code of California as amended provides that whenever a certificate of stock in a California corporation has been lost or destroyed the owner may bring suit against the corporation to obtain a duplicate certificate. If the stock stands on the company books in some other name than the owner, or it appears that other people have an interest, all such persons are also made defendants. Besides summons as in any civil suit, the clerk of the court must publish a summons in a newspaper in the county at least once a week for four weeks. The court must here evidence and may enter judgment cancelling the lost or destroyed certificate and directing the corporation, on payment of its costs, to issue the duplicate certificate. Actions against the corporation are thereafter forever barred as to the certificate or the shares represented by it.

IN loading holes in mine blasting, particularly the deep holes driven by machines in advancing headings, it is good practice to put a couple of sticks of No. 1 giant into the bottom of the hole, and put the principal charge of No. 2 powder on top of it nearest the collar of the hole. The reason for the practice is the fact that the bottom of the hole, being tightly bound in, escapes the full shattering effect of the explosion if the hole is loaded entirely with No. 2 powder. The collar blows off first and gives the gases from the bottom powder an opening to escape before they have done their work on the rock. With the No. 1 powder at the bottom of the hole, the generation of gas from it in exploding is so much more rapid than from the No. 2 that before the latter blows off the collar of the hole the former has accomplished its full work on the tight rock at the bottom of the hole.

PLACERS yielding fine gold, principally in top wash rather than on or in the bedrock, have the gold associated with clay rather than with the sand or pebbles. Such gold is generally brought to the deposit, by flotation in the stronger stream currents, in periods of flood particularly. In the water, sand becomes more or less "quick." The coherence between the grains diminishes and any fine gold particles in the mass readily slip between them to a more coherent formation beneath. The same is true with gravel. Clay deposited in place by a diminishing velocity of stream flow becomes coherent. Fine gold-reaching clay is held by it, and not until the clay mass is completely dissolved does it give up the gold to the stream current again. Clay works in underneath boulders in the stream beds and is there protected from the disintegrating power of the currents. Fine gold, moving along over the boulders of the bottom of the stream channel, works its way under the boulders and becomes imbedded in the clay next the contact with the under side of the boulder. This peculiarity is observable in drift mines. Next to crevices in the bedrock the place of gold pockets or aggregation are found in the small clay accumulations under large boulders, close to but not on the surface of the bedrock. In pan prospecting the distorting effect on average values of these pockets must be taken into account.

## The Sulphide Ore Problem.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by  
JAS. W. WOHSEY.

We now propose to deal with some of the many proposals made and tried by many clever men to treat this class of ore without any previous separation or dressing by machinery—that is to say, natural ores as mined.

As an expert in smelting, let me say that the trouble smelters experience in the modern lead blast furnace is the accretions the zinc produces all around the sides of this class of furnace and an imperfect settling out of the bullion—lead with silver and gold—from the slag. Reverberatory furnaces are better able to deal with this, owing to the prolonged period in which the melt stands in the furnace; but this is impossible if the zinc exceeds 12%, no matter what flux is used or how much. The presence of zinc in these ores is certainly the cause of all this trouble and loss in smelting, and, therefore, it very naturally occurred to the metallurgist that to extract the zinc from the ore would end the trouble. In 1877 we find E. A. Parnell of Swansea—formerly of St. Helens—took out a patent which had this object in view. He first calcined the ore, then dissolved out the zinc oxide by strong sulphuric acid, afterwards decomposing the zinc sulphate by zinc blende or carbon. The oxide so formed was used in the manufacture of spelter in the ordinary way. The lead residues were smelted in a cupola in the usual manner. This was worked with fair success for several years and was at last given up. The principle here was doubtless a right one at the outset, but the treatment of the extracted zinc was too much to make it a paying success.

Quite a number of experimentalists followed Parnell on the lines he had worked, including the Broken Hill Company, who, I am told, spent a large sum in trying to leach the calcined ore in vats of large size; but this failed, having destroyed all the pipes, taps, and other fittings connecting them.

Peter Spence tried a process based upon the fact that the galena was attacked in preference to the blende by hot hydrochloric acid; but this was of no practical service.

Peter Hart of Manchester, Eng., in 1891, took out a patent in which sulphuric acid was used. The strong sulphuric acid used formed sulphates, and zinc sulphate being soluble in hot water, was easily removable, leaving the insoluble lead sulphate behind. But the strong acid did not dissolve sufficient of the zinc, and, the ore being crushed fine, leaching out the same was impractical.

Fabrik Rhenania, a German chemist, took out an English patent in 1899 on exactly the same lines as Peter Hart and with a like result.

Ryan & Hughes brought forth a process for the extraction of the zinc from ores, or other substances containing same, by means of caustic soda and precipitating same by means of carbonic acid. Nothing seems to have ever come of it, the appliances and reagents being too costly.

Swinbourn & Ashcroft introduced a process in which the lead zinc ores, after being ground finely, were made into a cream with chloride of zinc and sodium or potassium chloride. This cream was put into a converter of special design, and into this at the bottom chlorine gas was forced and heat applied. The chlorine was rapidly absorbed by the metals and sulphur eliminated. Nothing has ever been heard of this. The appliances and cost will, in the writer's opinion, make it prove unremunerative.

S. Gaulin, in 1897, introduced a process which in some respects shows some rather new features and possibilities. He avails himself of the fact that galena introduced into a bath of molten anhydrous zinc chloride results into a double decomposition with the formation of zinc sulphide and lead chloride, any silver present being contained in the lead salt. Metallic zinc added to the melt will result in the formation of argentiferous lead, with the regeneration of a fresh quantity of zinc chloride. This process seems both too complicated and costly.

Gay De Bechi of Paris introduced a process in which the ground ore was mixed with 5% or 10% common salt, roasted in a reverberatory furnace and lixiviating afterwards with water. The solution contained all the metals present as chlorides, which he afterwards separated by fractional precipitation. He is still working on his process in the north of England, but has not published any facts of his working there, so far. But chlorides of the metals are not good salts to work and do not make possible a clean separation of one metal from another.

F. L. Bartlett brought out a process for the volatilization of the lead and zinc as sulphates and oxides suitable for use as a pigment. So far, however, nothing has been heard of the financial success of its working. In the lower Harz a process worked on similar lines was abandoned in the year 1880, some of the chief drawbacks being that a large percentage of the lead was volatilized along with the zinc oxide, carrying along with it a large proportion of the silver, owing to the high temperature required for this

purpose. The fumes collected consisted chiefly of lead and zinc oxides and sulphates, as well as small amounts of silver. By leaching these with sulphuric acid the lead was separated from the zinc, but the zinc sulphate thus formed did not prove to be of much value.

P. Ellerhausen's English patent, in 1897, in several features resembles the Bartlett process, and so far does not seem to answer its designed ends.

Passing by a number of processes of trivial importance, we turn to one by Fry & Everett. This process consists in first grinding the ore, then calcining, afterwards smelting same with a flux consisting of 5 cwt. salt cake and 2½ cwt. of oxide of iron to every 20 cwt. of ore. In their published statement of working they say that they recover about 90% of the lead, all the silver and gold, and that about 90% of the zinc passes into the slag. This latter is mixed with a small quantity of coal and passed into a Siemens gas furnace, where the zinc passes off quickly as rich zinc oxide and is sold for the production of spelter. So far, this sounds well, and would be well if it were true. The directors of this company, who met their shareholders on April 26, say that it is practically impossible to carry on the business, owing to a number of difficulties they experience, and one of these is "losses of metal." I am told by a private source this amounts to nearly the half of their assay value. I have a sample of their zinc oxide and find it contains 6% lead. This, besides losses in their slag and furnace, must have been the cause of the company's downfall. They were never able to properly separate the lead and zinc, and like the works in operation on the Harz, as before named, of which it seems to be a copy, came to a like ending.

(TO BE CONTINUED.)

## Commercial Education for Engineers.

By L. S. RANDOLPH, MEM. AM. SOC. C. E.

In an article on this subject which appeared several years ago the writer said that the value of the engineer was measured by a money standard. Not only does he still hold to that opinion, but subsequent study and observation have more than ever convinced him of the truth of this declaration. If, then, the work of the engineer is measured by a money unit, is it not wise that he himself be taught to measure his work by this most important unit? We teach him to measure small distance to the forty-thousandth of an inch; we teach him to measure the distances of hundreds of miles to the fraction of an inch; we teach him to weigh to the ten-thousandth of a pound, and yet fail to teach him the unit of measure by which alone the world measures him and his work, and upon the results of which measurements his reputation and rewards are based.

Doubt may be raised as to the correctness of the statement that the work of the engineer is measured by a money unit. Let us, therefore, examine this point somewhat more at length. The early engineers built bridges which were considered wonderful if they did not fall down; the first locomotives were considered wonderful if they ran at all. At that time the bare fact of the structure performing the work for which it was intended was the only result demanded. Let us try to imagine how long the locomotive designer would stand to-day who simply turned out a locomotive that would run; or a bridge engineer who would build a bridge whose only good point was that it would carry the load. No clearer proof of this proposition could well be furnished than the results of the competition between British and American bridge works for the Abbara bridge contract in Africa, so much spoken of at the time, several years ago, and a more recent one for a railway viaduct in India. In the former the American-built bridge cost one-third less than the proposed British structure, and was erected in a little over half the time; in the latter case the cost was 43% less, and the work was erected in one-third the time. When we remember that time is money, we can see that in these cases, at least, the sole measure of the capacity of the different engineers was money. It may be urged that this was a business proposition and not an engineering one; that it was due to executive ability and not to engineering skill; but, when we consider that about one-half of the engineering fraternity are in executive positions, and that every detail of the work, from the mining of the ore to the final testing of the bridge, was in the hands of engineers, this argument falls to the ground.

## Precipitating Gold Values in Slimes.

TO THE EDITOR:—Some readers of the MINING AND SCIENTIFIC PRESS will be interested in an invention which has been introduced in a few of Colorado's stamp mills. The process, only lately patented in the United States, is a very simple one. Underneath the pulp, after it leaves the battery, a halogen gas is introduced in such a way that all the pulp becomes impregnated. Through the action of the gas the slimes, which carry away fine values, are disinte-

grated, and the natural result is a precipitation of the values which were floated away. At the same time the halogen gas liberates free oxygen, which cleans the particles of gold which otherwise would not be amenable to amalgamation.

Under the writer's own observation different trial runs were made in H. E. Wood's sampling works at Denver, Colo., with very good results. The increase in the gold amalgamation on the plates varied from 8% to 18%, according to the nature of the ores. The concentrates were also a great deal improved, the silica in some of the ores being reduced from 16% to 8%.

Through the influence of the free oxygen the plate itself is kept in a very fine condition and the quick-silver never gets fouled or floury.

Denver, Colo.

EDW. A. CANE.

## Automatic Sampler, Smuggler Mills, Aspen, Colo.

Written for the MINING AND SCIENTIFIC PRESS by S. I. HALLETT.

In order to make correct or approximately correct samples of ores, it is necessary, before cutting out the sample, to crush the ore to such a degree of fineness as to insure a thorough mixing of the minerals and gangue so that the sample may represent as nearly as possible a true average of the whole lot.

This result is accomplished in sampling works by taking a large sample while the ore is coarse, re-crushing same between the several cuts and so proportioning the cuts as to be in a ratio practically conforming to the fineness to which the crushing is carried, thus with the minimum amount of crushing work securing, in the final cut, a sample sufficiently fine and thoroughly mixed as to truly represent the entire lot.

In concentrating mills, particularly coarse concentrators, it is very seldom possible to get a correct sample at the head of the mill for the reason that the ore is not sufficiently crushed and thoroughly mixed and can not be truly representative in a proportionally small sample that may be cut out previous to its separation by the trommels; therefore calculations based upon laboratory results obtained upon such a sample when computed in connection with the smelter returns may make the mill work appear to vary greatly from the work made apparent from examination of the tailings.

In such cases it would seem to be advantageous to figure backwards in connection with the smelter returns, relying on the thoroughly crushed and well mixed product of the tailings launder to obtain the sample to be used in connection with the smelter returns as a basis of calculation; and, when this is done, it is necessary to have an automatic sampler that may be depended upon to faithfully and correctly cut the stream at regular intervals, and which may be isolated and locked beyond the possibility of interference by meddlesome persons or interested employees.

The drawings shown on opposite page are intended to represent the details of construction of such a sampler now being used very successfully. It was originated by Mr. Cole, the superintendent of the Smuggler mills at Aspen, and is in use there now. There is nothing new about it, unless it may be the use of the friction device for holding the tippie tank in position during the filling of one end of same and in the use of the pneumatic check for controlling the speed of the cutter in passing through the stream of tailings. These, however, have been found to be very valuable features of the machine, as, without the friction device, the machine was found to tip so easily that the interval could not be made long enough without closing the water valve so nearly shut that the stream would be reduced almost to drops, and, when so operated, the valve would continually clog up and stop the operation of the machine. The friction device is adjustable and may be set to hold the tank until the water has filled it very nearly full; thus the interval may be made as long as half an hour with the valve open so as to deliver a stream as large as a quarter of an inch in diameter. But when the tank is released with such a large quantity of water to overbalance it, it was found to fall so quickly as to pass the cutter through the stream with such speed as to defeat the object of the machine.

In order to control the velocity of the cutter when passing through the stream, the pneumatic check was designed and applied. It is simply a well-joined square box, open in the middle and closed at each end, forming comparatively air-tight recesses in which wooden pistons work. These pistons are so fitted as to work smoothly and easily and are not packed in any way. They are connected together by a wooden rod, which is actuated by the cutter lever. The piston boxes are penetrated at their outer extremities by a 1½-inch hole, covered by a controlling button, which latter is adjusted in making the speed of the cutter as the operator may choose.

In operation, this pneumatic check offers no resistance to the starting of the lever, but it immediately begins to operate when it has begun to move, and, by means of the buttons, may be made to take the time in passage that experience may demonstrate as best.

Electric Hoists on the Comstock.\*

By LEON M. HALL.

With the advent of electricity on the Comstock it became necessary to take up the problem of hoisting from considerable depths by means of electrical energy, and after much research and a thorough investigation of the then existing electrical hoisting machinery it was evident that, in order to meet our conditions of service and power, we must procure something radically different from the usual run of such machinery. The writer, then, after discussing the matter with the Risdon Iron Works of San Francisco, decided on the system as explained in this article, the ultimate result being the development, installation and operation of a continuous rope electric hoist, driven by means of a variable speed, three-phase induction motor.

The power for the Comstock is developed on the Truckee river at a point near Floriston, 33 miles from the mines in Storey county, Nevada.

The generating station is equipped with two 750 K.W., 3-phase, 60-cycle Westinghouse generators, and six 300 K.W. oil-cooled transformers. McCormic turbines are used to drive the generators and a close regulation is secured by means of Lombard governors. At the station the potential is raised from 400 volts to 24,000 volts, at which pressure it is transmitted over a double circuit of No. 4 hard-drawn copper wire. At the sub-station in Virginia City the potential is reduced to 2300 volts, and in this form is distributed to the various mining companies. In the case of each hoist but one—namely, that at the C. & C. shaft—it is again reduced to about 450 volts.

The power is purchased from the Truckee River General Electric Co. upon a continuous rate basis, the amount being fixed by a peak load of two minutes' duration.

Under these conditions it has, therefore, been the endeavor of the mining companies to secure a hoist that will operate at the highest possible efficiency and at the same time effect the regulation of the system to as slight a degree as is consistent with good service.

To meet the condition of high efficiency it is evident that the motor should operate continuously at or near its full load capacity, and be designed especially for the work it has to perform. For a continuous full load condition, the work must of necessity be constant at all points in the lift, and the nearest possible approach to this was secured by the adoption of the continuous rope or balanced system, where the load is reduced to the weight of the rock alone. Then, to secure the necessary variations in speed, an induction motor with a non-induction resistance in both primary and secondary was developed, the resistance being varied by the introduction of a modified form of the ordinary street car controller. With an equipment of this kind the cages are started slowly and the dip in line voltage is comparatively slight, being about 7% at starting. By running on the second notch of the controller one-third of the maximum speed may be maintained for the full length of the shaft.

The hoist itself consists essentially of a main driving drum and an idler, around which the rope is wrapped four times in order to secure the necessary friction for lifting. From the main driving drum the rope is carried over the head sheave, down one compartment, under a movable tail sheave, back the second compartment, over a second head sheave, and on to the driving drum. One cage is inserted between the ends of the cable and the other fastened by means of heavy iron clamps, one above and one below the cage in the adjacent compartment. This simple arrange-

ment enables us to vary the relative position of the cages at pleasure, and also permits us to use one cage in a single compartment without reference to the other.

The hoist is necessarily a geared machine, the motor speed being reduced by the introduction of cut gearing. To the main drum is attached a brake ring, upon which is operated a heavy post brake. This brake is set automatically by means of a heavy weight and is released by hydraulic pressure. In the case of the Yellow Jacket and Belcher there are two hoists, side by side, both being operated by one motor. One of these is intended for the vertical shaft and the other for the incline, which leave the vertical at the point where the vein intersects it. Double-deck cages are used in each compartment of the vertical shafts and a two-ton self-dumping giraffe in each compartment of the inclines.

The hoists have been erected in the most substantial manner, upon concrete foundations, and there is practically no vibration and very little noise.

The table below gives complete data upon each of four installations.

In each of the foregoing the continuous rope or balanced system has been adopted and the actual load lifted amounts to the weight of the rock alone, plus the friction losses. The load is constant at all points in the lift and the strain upon the mechanism equalized at all times, except when starting and stopping.

The Yellow Jacket hoist was a success from the start and was operated for more than a month with single cage in one compartment. This is the severest test to which the hoist can be subjected, and under these conditions the performance is as near perfection as any hoist I have ever seen. Tests were made during this time and the following are the results:

Weight of cage, 1200 pounds; weight of car, 850 pounds; weight of rock, 1600 pounds; total weight lifted, 3650 pounds.

Maximum rope speed, 600 feet per minute.

Length of vertical lift, 1175 feet.

Time of hoisting, two minutes and ten seconds from the moment the load was started until the cage was landed on chairs at the surface.

Time to accelerate load, eight seconds.

Power required as per watt meter reading, 88.40 H. P.

Theoretical power required, 66.40 H. P.

Efficiency of the system is, therefore, about 75%, and this includes motor efficiency and all friction losses from secondary transformers.

Secondary voltage was 525 volts before starting and the running voltage slightly over 500.

The maximum current per phase at starting was 180 amperes and 85 amperes when operating at full load.

A reading was also taken while lifting the empty cage at 600 feet per minute, and the watt meter showed 48 H. P.

It will, therefore, be seen that the results obtained are remarkably good, and no trouble should be experienced with a hoist of this character upon any well-regulated plant. I will add that the successful operation of this hoist is a decided advance in mine hoisting—not alone in the high efficiency secured, but also in the large capacity as compared with the size of the motor in use. Of course, there are cases to which this system is not adapted, but wherever it is applicable it is certainly worthy of serious consideration, where economical operation is a feature of the development. All four of the above hoists were built by the Risdon Iron Works of San Francisco. The cut attached is from the experimental model submitted to the writer. All four hoists are built so that the speed can be doubled, using two motors instead of one. This would give twice the capacity named in table.

Calkins' Umpire Ore Sampler.

The Umpire ore sampler, so its manufacturers claim, will quickly and correctly sample ore in quantities from 1 to 100 pounds. As shown in the sectional view, both buckets are divided into quarters; two of the divisions in each are closed,

and two open; therefore, if sixteen pounds of ore is placed in the hopper and the machine operated, eight pounds remain in the upper bucket, four pounds in the lower and four pounds, or one-quarter of the entire amount, passes into the receptacle at the bottom. By feeding the four pounds obtained by the first operation, a one-pound sample would result, or one-sixteenth of the whole; a third feeding would obtain one-sixty-fourth, and a fourth, one-two-hundred-and-fifty-sixth of the original sample. F. W. Braun & Co., of Los Angeles, Cal., are the manufacturers.

The patent specifications of the Edison storage battery all show the great amount of work, and thorough investigation of obscure and delicate differences of chemical reactions and of electrical behavior, on which the invention is based. To prepare the iron cell, monosulphide of iron was first crushed to 200-mesh size. Eight parts of this by weight were next mixed with about two parts of flake or mica graphite of a size considerably larger than the perforations in walls of the cell pockets. The mixture was then moistened with a 20% solution of potassic hydroxide and packed in the pockets by a tamping tool. The graphite not being flexible, the mixture packs to a hard, porous mass, which is not disintegrated by gas formation. After packing the pockets almost to the top, a wad of asbestos fiber of about 1/4-inch thickness is put in the pocket. On top of the packing a sheet of perforated nickel is fastened by wires. The element is then oxidized electrolytically in a solution of potassium hydroxide. Sulphur is disengaged and forms soluble sulphide of potassium, which diffuses out the mass while ferrous oxide is formed in the cell. The oxide is more bulky than the sulphide and produces pressure on the cell walls, which retains the cell filling from disturbance in place. The use of the monosulphide results in securing the largest possible quantity of oxide in the smallest space. Many tests of other methods of formation were made, but only the method described gave an effective result. In the form obtained, the oxide was reduced to iron, electrolytically completing the cell. Chemical differences detailed by the inventor, though not always explained or explainable, show that other methods or starting points do not bring the desired result. The oxygen-storing element, which it is declared can be either nickel or cobalt—nickel being the cheapest, and therefore employed—is prepared by precipitating the monoxide or black hydrated dioxide in the usual commercial way, purifying and drying it, and finally pulverizing it. Seven parts by weight of this and three parts by weight of the mica graphite are mixed and moistened and the pockets filled and enclosed, as described above. The plates are then electrolytically treated in a solution of potassium hydroxide with an oxidizing current for a considerable time, the oxidation of the nickel being either raised to a higher stage of oxidation than the black oxide  $Ne_2O_3$ , or the excess oxygen being absorbed in some undiscovered form. The special features are permanence and indestructibility by use, and the superior selective applicability of the several materials employed. The ingredients are all insoluble. The supporting plates are unaffected by the materials or the electrical reactions during use.

\*See illustration on front page.

## Mining and Metallurgical Patents.

Patents Issued July 30, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS

PROCESS OF EXTRACTING ARSENIC, ANTIMONY OR TELLURIUM FROM SULPHUROUS ORES.—No. 679,330; E. Petersson, Brussels, Belgium.

A process for the removal of antimony and tellurium from sulphurous ores containing also arsenic, by direct volatilization, consisting in admixing the ore in a powdered state with powdered carbonaceous material, heating mixture while protected from atmosphere to a temperature sufficient to volatilize any arsenic present as arsenious and arsenic sulphide, and further heating to a higher temperature to volatilize antimony as antimonious sulphide and also drive off tellurium, but not to temperature sufficient to effect a substantial reduction of remaining sulphides.

GOVERNOR FOR WATER WHEELS.—No. 679,353; E. E. Woodward, Rockford, Ill.

A speed regulator; a friction-disk shaft; two friction disks loosely mounted on shaft; a friction wheel fixed on shaft between friction disks; a gate operating shaft; a rotatable connection between one friction disk and gate-operating shaft, to rotate shaft in one direction; a rotatable connection between the other friction disk and gate-operating shaft, to rotate shaft in contrary direction; tappet arms for moving friction-disk shaft to throw the friction wheel into engagement with either friction disk; a cam for engaging tappet arms; a shaft for cam; a friction disk on shaft; a friction wheel having contact with friction disk; an inclined screw-threaded shaft for friction wheel, and means for rotating screw-threaded shaft when the power valve is operated, to raise or lower cam from engagement with tappet arms.

AMALGAMATOR.—No. 679,355; J. H. Barr, Kansas City, Kans.

A pan having a series of V-shaped pockets to contain mercury, and a cover for pan provided with V-shaped baffle plates adapted to depend centrally

over pockets, the two forming a vertically-tortuous passage whose cross area is greater in vertical planes intercepting baffle plates whereby passage may be made of uniform cross section by provision of liquid mercury in pockets.

APPARATUS FOR TREATING METALS BY ELECTROLYSIS.—No. 679,357; A. G. Betts, Upper Troy, N. Y.

An electrolytic vat and electrodes; track adjacent to vat; a carriage on track; a reversible motor for moving carriage; an automatic switch for reversing motor at either end of path of movement of carriage; means for automatically causing motor to operate intermittently to move carriage in one direction; electrode raising and lowering mechanism on carriage; means for automatically operating electrode raising and lowering mechanism during intervals between successive intermittent movements of carriage, and a pair of pressure rollers mounted on carriage in the path of raised and lowered electrodes.

ORE ROASTING AND DISTILLING APPARATUS.—No. 679,452; G. D. Burton, Boston, Mass.

A rotary furnace provided with hollow electrically conductive axles and with interior heating rods in electric connection with hollow axles, means connected with hollow axles for passing an electric heating current through axles and rods, a pipe connected with one of axles and provided with branches, receivers connected with branches for collecting by-products, and an exhausting device connected with receivers.

ROTARY FAN AND PUMP.—No. 679,499; S. C. Davidson, Belfast, Ireland.

A rotary member having numerous elongated blades arranged lengthwise in approximately axial direction, and in drum form, so as to inclose within

them a relatively large and practically unobstructed intake chamber, and in transverse section arranged, relatively to the axis and direction of rotation, to carry fluid with them rotatively and discharge it tangentially, rotary member being open at both ends so that fluid operated on may be taken in axially through both ends thereof, and having a hub, annular supports engaging outer edges of blades and adjustable stays connecting supports with hub, and means for so mounting rotary member as to permit tangential escape of fluid discharged from blades.

AIR COMPRESSOR.—No. 679,335; D. Pryde and H. Guerman, Braddock, Pa.

A cylinder having a stationary body and heads, body being provided with an annular row of air-inlet ports at each end, of piston in cylinder, of rings movable over heads and projecting into body, and means for moving rings to alternately cover and uncover ports.

## Cooling Water by Compressed Air.

TO THE EDITOR:—Cooling water by means of compressed air is an easy matter. The cold, expanded air should only be led through a pipe or coil of pipe dipped into the water to be cooled, and then exhausted into the atmosphere.

The writer can recall a fact of personal experience, when in charge of some tunnel work. A ventilator fan blowing fresh air to the front was actuated by a small steam engine working with compressed air, the exhaust of which was led into a closed chest containing tin tumblers filled with water. On its way to the discharge orifice the current of escaping air was passing along the row of tumblers, and some ten to fifteen pounds of ice were thus daily made quite readily. The miners felt interested in the progress of the refrigeration, and the men of the outgoing shift would seldom fail to dip a dusty finger into some of the tumblers, whose main peculiarity was the existence of a black core at the center of the block of ice. When air at a given pressure and temperature is allowed to expand adiabatically to say atmospheric pressure, there is no theoretical difference between the volumes of the air, and consequently its temperature, at the moment when the lower pressure is reached. In practice the results are quite at variance.

The air which has done expansive work behind a piston moving in a cylinder escapes at a low temperature and at a moderate speed, and is fit for use as a refrigerating agent. Such is the principle applied in the Bell, Coleman and Allen air engines.

In the air which is simply released through a valve the whole expansive work is converted into velocity, and almost instantaneously transformed into heat, by friction with the surrounding atmosphere or against the neighboring bodies. The result is that no cold can practically be produced in this manner.

Besides, the use of an expansion cylinder coupled to the compressing cylinder reduces to a minimum the actual amount of work required by this process of refrigeration. Its efficiency is low, and it is not economical on a large scale as compared with the ammonia process; but it possesses advantages of simplicity, of cheapness and of safety, which in many cases will make it quite valuable.

San Francisco, Cal., Aug. 8.

A. E. CHODZKO.

W. A. R. LOOSE, of Provo, Utah, so the Salt Lake City, Utah, Tribune says, is the inventor of a novel method of reduction for certain copper ores which he recently tested successfully before a number of interested mine owners. In the process, carbonates of copper, occurring in the form of malachite, azurite, etc., are first reduced to metallic copper, after which the metal is separated from the gangue. In the process the crude ores are crushed to an eight-mesh, mixed with a small percentage of powdered charcoal and dumped into a hopper. From this it is passed into revolving wrought-iron tubes and is subjected to a temperature of 1800°. From these tubes the ores pass by gravity into a tank of cold water, the bath to which they are subjected protecting the ores from reoxidation by contact with the air and releasing the metal in the disintegration of the siliceous gangue. The product discharged from the bath contains the metallic copper in shot-like particles in blackened silica. After screening through a sixty-mesh it is passed over tables by which the particles of bright copper are separated from the gangue, collected, and are then ready for refining.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

#### JUNEAU.

The work in the Last Chance G. M. Co. tunnel and shaft, near Juneau, is completed. The tunnel is in over 2000 feet. The 2000-foot pipe line is laid from the flume to the head of the tunnel shaft and hydraulicking has been commenced.

President A. Raymer of the Windham Chief G. M. Co. is starting development work on the mine at Windham Bay.

For the month ending July 15th the Alaska Mexican M. Co. reports 14,894 tons ore crushed, yielding \$13,747 and 235 tons sulphurets, valued at \$5666. The gross yield was \$21,197 and the working expenses were \$20,039. Ore averaged \$1.42 per ton.

The Alaska United mine crushed 28,024 tons ore for the month ending July 15th, valued at \$29,740, and 520 tons sulphurets, valued at \$12,624; gross yield, \$46,305; working expenses, \$36,999; average value of ore, \$1.65 per ton.

### ARIZONA.

#### COCHISE COUNTY.

The new four-compartment shaft at Tombstone is now down 250 feet. One drift run at the 100-foot level was run and connection made with old workings on the Contention. Another drift is being started at the 250-foot level to make air connections with the old works. The shaft is now about half way to water level.

#### COCONINO COUNTY.

The Ridenour copper mines at Pine Springs have been bought by A. Boren, representing Pittsburg, Pa., people, for \$50,000.

#### GRAHAM COUNTY.

The Copper Matte M. & M. Co. has incorporated, capital \$500,000. The principal office will be at Tucson. The mines are in the Greenlee district, near Clifton. E. E. Frye, W. M. Griffith and B. F. Jossey are the incorporators. Contracts for development work have been let to P. F. Crowley of Tucson, who has already commenced work. One tunnel is now in 230 feet and has cut a large body of sulphide ore.

#### MARICOPA COUNTY.

A proposition for the establishment of a custom smelter in Phoenix is being promoted by J. S. Loder of Denver, Colo., who is seeking to enlist local capital.

The Relief G. M. Co., capital \$200,000, is being incorporated at Phoenix to operate the Relief mine, located 20 miles northwest of Phoenix; the incorporators are G. Hamlin and G. A. Treadwell of Phoenix and S. S. Morse of New York. The company propose to begin immediately on development work and the installation of machinery. It is expected that twenty stamps will be put in.

#### PINAL COUNTY.

(Special Correspondence).—The Arizona Copper Hill M. Co., with principal office in Denver, Colo., are considering the matter of erecting a leaching plant on their property near here. Recent development has disclosed bodies of copper ore that it is thought can be profitably treated. Oracle, Aug. 3.

#### YAVAPAI COUNTY.

A New York company is reported as having bonded the Bullard mines, 50 miles west of Congress, at \$500,000, paying some cash down to J. Bullard of Congress, the owner. The mine is a copper-gold proposition.

The Baumann Copper Co. has been incorporated at Prescott, capital \$600,000, to work the Baumann group of mines at Agua Fria. There are twenty-five claims included in the property. H. P. Anewalt is president, J. Baumann secretary and general manager and W. S. Goldsworthy treasurer, with office at Prescott.

#### YUMA COUNTY.

G. W. Upton, said to be representing Clinton, Ia., capitalists, has made considerable development of the Gold King and Mountain Ridge mines, near Octave. One tunnel is in 900 feet and has shown up considerable ore.

### CALIFORNIA.

#### CALAVERAS COUNTY.

The Deep Gulch quartz mine at Mokelumne Hill, owned by Nunes & Kiser, has been bought by a company represented by D. Balch of San Francisco, who is now operating it.

W. H. Clary of the Commodore mine, near Mokelumne Hill, says the final payment has been made on the bond and the title passed. Work on the mine will soon be resumed. It is probable that a mill will be put up.

### EL DORADO COUNTY.

G. E. Lukens of Auburn, Cal., and E. Dubois of Redding, Cal., have bought the Wilhelm quartz mine, near Centerville, from Koeckel Bros. The new owners will begin development in a short time.

W. B. Barstow of Manila, Iowa, and F. B. Thomas of Montana have recently bought an interest in the Josephine mine at Volcanoville. Work is being done in the lower tunnel under the management of J. M. Nougues Jr.

The Union Con. G. M. Co. has incorporated, capital \$10,000, to operate a mine near Georgetown. J. H. Morton of Georgetown is one of the incorporators.

### GLENN COUNTY.

F. W. Eaton, owner of the Lion copper mine, located near Stonyford, has leased it to a syndicate. This mine was located and incorporated on June 15, 1867, with a capital stock of \$108,000, but has been closed since. The mine will be operated and machinery put on.

### NEVADA COUNTY.

The clearing out of the old 600-foot shaft of the California mine at Grass Valley has been commenced, under the management of Supt. Lawrence. The company will erect a hoisting plant.

The Grass Valley Exploration Co. have commenced cleaning out and sinking the shaft on the Crescent mine, which is not involved in the pending litigation. In the early days the Crescent produced some good rock, and the shaft was sunk only to a depth of 200 feet. The machinery now on the Telegraph mine will be removed to the Crescent.

### PLACER COUNTY.

The Black Canyon M. Co. are placing some hoisting works at their quartz mine above Westville. The tunnel is in on the ledge 400 feet. An upraise of 180 feet has been made and a shaft will be sunk in on the main tunnel.

The development of the Azalea mine at Blue Canyon was resumed on the 1st. A. Rogers is Supt.

### PLUMAS COUNTY.

A. E. Murdock, superintendent of Last Chance mine, reports eight men at work in the mine. The incline is down over 150 feet on the ledge. There is 7 feet of ore in the heading, carrying gold, silver, copper and lead to value running from \$40 to \$103 per ton. A meeting of the directors of the Last Chance G. & S. M. Co. has been held at Reno, Nev., and the proposition to erect a smelter considered. The mine is located within 6 miles of the main line of the N. C. O. and 7 miles from the Sierra Valley branch, connected with both lines by good roads.

### SAN DIEGO COUNTY.

At the California Gold King mine, near Yuma, the owners are preparing to spend a large sum in improvements, says S. W. Dorsey. All the material for a 1000-ton cyanide plant and for 5 miles of railroad is on hand. The company owns twenty-four claims, a free milling proposition. The ore assays \$3 to the ton.

Receiver C. W. Pauly of the Golden Cross mines in his June report shows receipts \$28,196.73 and expenditures \$20,024.22. The value of the bullion produced by the stamp mill during the run from May 6 to June 7 was \$15,042.54, the returns from the cyanide plant \$11,992.09, and from other sources \$1162.10. The expenditures included, among other items: For labor, \$7398.49; freight, \$1229.05; fuel, \$663.15; merchandise and supplies, \$9596.12. The report also includes a statement of the development work, showing that 345 feet of drift and winze had been made during the month. The estimated cost of sinking the shaft in the Cross mine and the winze in the Crown was about \$5 per foot, and the drifting in the Cross and the Queen about \$4 per foot.

### SHASTA COUNTY.

J. H. Roberts of Sacramento, L. A. McIntosh of Chico and I. O. Jillson of Hornbrook, Siskiyou county, have recently bought from J. H. Walkotte the Gladstone mine near French Gulch, together with the improvements, for \$7500. In the course of the old operation of the mine a drift was started which was expected to tap the pay shoot at a depth of 800 feet. The tunnel was run for a distance of 2500 feet at a cost of \$25,000, and then work was stopped. The buyers undertook to do a little development work and began extending the lower drift. After running 70 feet they cut the ore body. The ledge is 8 feet wide and the pay shoot is over 80 feet long. It is believed that the ore will average \$15 per ton. Ten stamps are in operation, and preparations are being made to start the other ten stamps.

The mill at the American mine, at French Gulch, has been shut down for the season. Development work will be continued in the mine. A new drift is being run on the ore body. T. Irvin is Supt.

The townsite of Saltee, near the Bully Hill smelter, has been sold by Honn,

Moore & Arnold to J. M. Say of Los Angeles. Four copper claims near Saltee—the Honn, Moore, Arnold and Last Chance—are included in the sale. An official plat of the townsite will be made and lots sold. It is proposed to develop the claims.

### SIERRA COUNTY.

A fine body of ore has been struck in the upper tunnel of the Oakland mine, near Gold Lake, above Sierra City. With the completion of the lower tunnel the mine will be well opened. V. C. Julian of Oakland, Cal., is the owner.

### SISKIYOU COUNTY.

J. W. Conant of Callahan's has struck on Scott mountain a large vein of ore that he claims will mill \$15 a ton. The ledge is about 11 feet in width. He expects to put in machinery and a mill before spring.

It is said that the main vein of the Jillson mine, near Henley, has been struck again, and that operations on a large scale will be resumed in October.

H. Mattern, who has been operating near Henley, is reported to have made a good strike. His ledge adjoins the Jillson, and a 2-foot vein of ore that yields from \$50 to \$75 a ton has been uncovered for a considerable distance.

The Wabasha mine, near Coles, owned by H. Mattern of Ashland, Or., and Bennett & Reynolds of Minnesota, is reported to be developing favorably. A 3-foot vein that goes over \$40 to the ton has been struck.

### TUOLUMNE COUNTY.

The Gold Ridge M. & M. Co. has incorporated; principal office, Tucson, Ariz., and branch office, Sonora, Cal. The directors are C. G. Bacon, J. Monahan, E. Twist, W. Jones and E. A. Jones; capital stock, \$500,000.

### COLORADO.

#### BOULDER COUNTY.

The old Livingstone mine, near Wall Street, has been bought by the Tambourine Co. New machinery is being ordered and the shaft will be sunk 500 feet deeper.

#### CHAFFEE COUNTY.

The Latchaw M. T. & M. Co., at Buena Vista, C. M. Sharpe Supt., has been in operation several months and has put in considerable machinery and other improvements.

#### CLEAR CREEK COUNTY.

Fogg & Brown of Boston, Mass., will install a new machinery plant in their mine, near Idaho Springs. They expect to sink the shaft 250 feet deeper.

The Sporting Times group, near Georgetown, has been bought by the Sporting Times G. M. & M. Co.; W. H. Smith of Des Moines, Iowa, president and F. L. Schrott of Denver, manager at Georgetown. A 500-foot contract will be let to drive a new level under the pocket of ore taken out in the old workings.

The new fifty-ton concentrating mill of the Red Oak Co. at Georgetown has been started. The company have a streak of solid lead ore in the mine 6 feet wide and a large body of concentrating ore in connection with it.

L. Bisna & Co. shipped eleven tons from the Dunderberg mine, at Silver Plume, which milled at the sampling works 1022 ounces silver for first class and 254 ounces silver per ton third class, netting the lessees, after paying all expenses, \$1260.

The Brazil mine, near Freeland, owned by Morgan & Kennedy, has shut down. The development work upon this property, while it produced considerable ore, has shown that it will be necessary to put machinery upon the property.

### DOLORES COUNTY.

The Mt. Gorum Co. at Rico is upraising from the Smuggler tunnel for air. It is estimated that ore taken out from the raise will pay its cost. The company has bought more territory and now owns thirty-eight claims.

### FREMONT COUNTY.

The Nipple Mountain Tunnel Co., composed of Florence and Canyon City people, has a tunnel in about 300 feet on its claim at Wilbur. Assays recently made show \$16.40 per ton gold.

### GILPIN COUNTY.

A rich strike of silver ore has been made in the Klondike tunnel, near Black Hawk, owned by C. Feissner. The tunnel is now in 120 feet.

### GUNNISON COUNTY.

A. N. Perreault and W. N. Jones are developing the Deacon lode at Tin Cup. They shipped three cars of ore which netted \$50 per ton—\$30 in gold, 12% lead and the remainder in silver.

It is stated that a strike has been made in the Hard Cash group, near Marble. In driving the tunnel, now in about 200 feet, a 4-foot vein of ore was cut, which carries copper, silver and gold. It is understood the ore shows assay values of from 6% to 10% in copper, 50 to 150 ounces in silver and \$4 per ton in gold. The property is

owned by the Sulphide Copper Co. of Denver.

The Headlight G. M. & M. Co. has started work on its Spencer claims at Gunnison. Development work is being done with a view to selecting a site for the machinery. Six shafts have been sunk. L. C. Eberling is manager.

### JEFFERSON COUNTY.

The new pyritic smelter at Golden, lately started up, is claimed to be operating successfully. Dr. Carpenter, the builder and manager of the new plant, says the smelter has one blast furnace in operation at present, working at about one-third capacity. This is gradually being increased to full capacity, about 300 tons of ore daily. The foundations are in for two more furnaces, which will be added soon. The plant is now treating ore which runs about \$7 per ton with a fair profit. About 100 men are employed.

### LAKE COUNTY.

Some Leadville people have taken a lease on the Mammoth M. & M. Co.'s mine at Twin Lakes. The intention is to prospect on a vein opened up by the old shaft and later on sink the shaft.

S. E. Smith of Denver has made a rich mineral discovery near Twin Lakes in the Silver Serpent and Rattler claims. The lead is a vein of black manganese and hematite. Assays show 152 ounces silver, \$5 gold and 17% lead to the ton. Arrangements are being made for extensive development.

The Shumache property, in Echo canyon, owned by D. K. Orner of Twin Lakes, T. H. Warner of Salt Lake City, Utah, and M. M. Warner of Bloomington, Ill., has been leased to M. Orner of Twin Lakes, J. Schitzius and E. Stevens of Pueblo, who have also leased the Thomas mill.

A. D. McRay, manager of the La Plata G. M. & M. Co., says he has a 10-inch streak on the Mountain Quail which shows an average value of \$400 per ton.

### MINERAL COUNTY.

During July the mines of Creede shipped 408 cars of ore, or 7541 tons. The Batchelor shaft on "G" lease is being sunk by contract. The bids for 100 feet of sinking ranged between \$34 and \$45 per foot. The contractors on the Sunnyside Dev. Co.'s mine struck ore in the breast of the tunnel, which is now 750 feet in. The operators are troubled with bad air.

### OURAY COUNTY.

The Humboldt mine at Ouray is being operated by J. McMahon, former manager of the Wedge mine, under lease and bond from J. B. Farrish of Denver, owner of the Wedge.

T. J. Maloney has bought for himself and other Denver people eight claims in the Sneffels district, near Ouray, from the estate of J. Sullivan, for \$50,000.

T. J. Maloney of Denver has bought a group of properties in the Sneffels district near Ouray for \$20,000. The claims included are the Terrible No. 2, the Zigzag and the Clipper No. 2. A long tunnel is projected through these properties, in the course of which some large veins are expected to be cut.

### SAN JUAN COUNTY.

The Minnie Gulch M. & T. Co., Silverton, it is reported, will erect a large concentrating mill for the treatment of ores from the Tom Moore and Copper King mines. A gravity tramway of three-fourths of a mile will be required. It is calculated to continue the lower Copper King tunnel to a length of 4000 feet. The tramway from the Moore will end at the ore discharge of the Copper King tunnel, where the ores of both groups will be concentrated.

The Broadgauge mining property, located in Burns gulch, near Silverton, has been leased to J. H. Ryan of Red Mountain, who will commence development on it at once. The Broadgauge is one of the oldest locations in the county.

### SAN MIGUEL COUNTY.

The Alta Vista Co., at Telluride, has made the second payment of \$30,000 on the purchase of the Alta. The company is engaged in changing the equipment of the Bessie 200-ton mill from a cyanide to a concentration system, and expects to complete the work and have the mill running by Sept. 1. The 700-foot tramway required to complete the connection between the mill and the Alta workings is under construction.

### SUMMIT COUNTY.

It is reported that the Boss and Thunderbolt silver mines at Breckenridge have been bought by F. C. Goff of Denver. During the '80s this property produced about \$200,000 of silver.

### TELLER COUNTY.

The Legal Tender shaft has been timbered down about 650 feet. As a precaution against fire, 20 feet of masonry will be added to the top of the shaft and the top will be covered with iron doors. A

tunnel will be driven a few feet below the surface for exit in case of fire, and this entrance will also have iron doors. Much the same plan of construction will be followed in alterations to be made at the No. 1 shaft of the Vindicator.

The following is the list of dividends paid by Cripple Creek companies in July:

|                          |              |
|--------------------------|--------------|
| Mary McKinney .....      | \$ 60,000 00 |
| Portland .....           | 180,000 00   |
| Gold King .....          | 28,105 50    |
| Modoc .....              | 5,000 00     |
| Vindicator .....         | 55,000 00    |
| Gold Coin .....          | 30,000 00    |
| Consolidated Mines ..... | 19,000 00    |
| New Zealand .....        | 7,650 00     |
| Doctor .....             | 29,000 00    |
| Nugget .....             | 10,000 00    |
| Ingham .....             | 3,400 00     |
| Independence .....       | 240,000 00   |
| Strong .....             | 25,000 00    |

Total .....

Manager Coe of the Jo Dandy, Cripple Creek, has bought a 100 H. P. boiler lately on the Lucky Guss mine and the five-drill compressor formerly in use on the Elkton. His plans also include the installation of a larger hoist.

#### IDAHO.

##### BLAINE COUNTY.

The lessees of the North Star mine, on the East Fork of Wood river, have shipped seven or eight 20-ton carloads of ore this summer and have 150 tons of concentrating ore on the dump.

##### BOISE COUNTY.

Caswell Bros. of Boise, operating at Thunder mountain, are reported to have taken out \$17,000 to \$20,000 from the mine lately sold by them to W. H. Dewey of Boise, as the result of an eight days' run while the mine was under examination by the purchaser.

A discovery is reported as being made on Elk creek, 40 miles south of Thunder mountain, of tellurium gold ores. A number of samples from the ledge have run very high, one going over \$400 in gold.

##### CUSTER COUNTY.

The Yankee Fork, on Mount Estes, near Custer, formerly owned by J. A. McFadden but now by Boston parties, with J. Minear as manager, is increasing the milling plant from five to ten stamps and adding concentrators. A hoist is being installed.

##### IDAHO COUNTY.

G. Blaine, late Supt. of the Iron Crown mine on Newsome creek, has taken charge of the Jumbo, at Buffalo Hump, and has a force of twenty-five men at work in the mine and on the stamp mill. The lower level is in about 400 feet on the ledge, with a depth of about 200 feet.

M. O. Reed, general manager of the Inca M. Co., has received returns from a trial lot of ore sent to the smelter from the Mineral World claim of the company's group in the Seven Devils mining district, which show \$30.62 silver, \$8 copper and \$4 gold. After paying all smelting and refining charges, commissions, etc., the ore netted \$30.50 per ton.

J. Glare of Warren has sold his placer claims to C. T. Hathaway of Denver, Colo., for, it is said, \$25,000. The two claims in the property were located several years ago as placer ground and a good deal of gold was taken out. The formation itself appears to have furnished the gold, and when the surface was washed off there was exposed a slate formation filled with rich quartz streaks. The claims will be worked as a quartz proposition.

##### KOOTENAI COUNTY.

About fifteen men are at work at the Weber mine, on Lake Pend d'Oreille, cleaning the underground workings preparatory to starting up mining. The flume to the old combination mill is being repaired, and it is intended to put the concentrator in operation. F. Weber and S. P. Donnelly, who with A. B. Campbell of Spokane own the property, are on the ground supervising work.

The owners of a number of free-milling prospects at Tyson have decided to organize a joint stock company and put in a mill. H. W. Desgranges has gone to Spokane, Wash., as the agent of the owners, to secure information and prices. The mill in contemplation is to be in the nature of a prospector's convenience—possibly only a 2-stamp mill will be installed.

##### OWYHEE COUNTY.

A strong inflow of water at the 1000-foot level has practically stopped operations in the Poorman mine at Silver City for the present. Arrangements were made to commence sinking, but the flow of water could not be handled by the hoisting engine. It is understood that Manager Britt has recommended the installation of an electric pump.

The Cumberland mine, at Silver City, will be shut down until electric power is provided for both mine and mill. Mana-

ger A. Buckbee states that the cost of fuel compels this change. The change has been under consideration since the installation of electricity at the Trade Dollar mines. Mr. Buckbee states that it will be but a short time until all the properties in the vicinity of Silver City must close down or use the Swan Falls electric power.

#### MONTANA.

##### CASCADE COUNTY.

It is reported that the Moulton mine at Nelhart will be started up soon. This mine is owned by the Diamond R. Co., which is operating the concentrator at Nelhart. The Moulton has been idle several years and is known to contain a large body of low-grade ore which will concentrate profitably.

##### FERGUS COUNTY.

(Special Correspondence).—The Kendall G. M. Co. has begun work on a ditch for water and power supply. The ditch will have a capacity of about 6000 miner's inches of water and, with the dam, is expected to cost about \$10,000. Grading for foundations of the power plant has been commenced, and the construction of the new cyanide milling plant of the Kendall Co. at North Moccasin is being rapidly advanced. The plans of the new mill have been changed and provide for 500 tons daily capacity instead of 300 tons as first projected. The shipments of high-grade ore from the Spotted Horse at Maiden for July amount to about \$6000. The Spotted Horse mill has been added to, and with new methods of ore treatment to be employed, it is thought that there will be no necessity for further shipment of the high-grade ore.

Lewistown, July 31.

##### FLATHEAD COUNTY.

A. F. Boardman has four men at work developing his Fourth of July creek claims, near Libby. The Bluebird particularly is making a good showing. About fifty tons of gold ore are piled up on the dump at this claim, taken out in developing the prospect.

##### JEFFERSON COUNTY.

The Colorado M. & D. Co., composed principally of Butte people, is sinking a shaft on the Hidden Treasure claim, near Corbin. It is the intention of the company to continue sinking until the 150-foot mark is reached. The ore is good, assays showing it to have \$1.60 in gold per ton, ten ounces of silver and 8½% of copper. Some of the Butte stockholders are M. Medin, E. L. Mayo, C. Heilbronner, F. Harris, C. Lane and J. Trerise.

At the Boulder-Comstock property, about 2 miles from Basin, A. S. Ray, operating a lease and bond, has been sinking a two-compartment shaft, which has reached a depth of 175 feet, and has struck a considerable body of high-grade copper ore.

##### LEWIS AND CLARKE COUNTY.

G. Austin of Marysville has just opened up a body of gold ore on his claim, about 4 miles from Marysville, that assays at the surface from \$6 to \$50 a ton.

##### MADISON COUNTY.

(Special Correspondence).—The Hecla Con. M. Co. of Melrose operated a crushing and jigging mill at their mine, 12 miles west of here, from 1882 to 1896, in that time piling up over 100,000 tons of mill tailings. Recently the Greenwood M. & M. Co. was organized by Montana people to handle these tailings. The old mill was remodeled and provided with modern crushing and concentrating machinery. The plant is now operating on about 200 tons per day, doing satisfactory work. The material carries silver and lead. The final tailings from the tables are cyanided. Mr. Hascott of Melrose is manager.

Melrose, Aug. 3.

The Alder Gulch M. & M. Co. has been incorporated in New York to operate the Bell and Grand Union mines, located in Alder gulch, and owned by L. B. Bell of Virginia City. It is the intention of the company to begin the preliminary work for the erection of a forty-ton mill. The president of the company is K. W. Robbins and the treasurer is F. Girtanner, both of New York City; M. B. Davis of Virginia City is manager.

Raber & Strobeck have taken a lease on the west end of the Keynote mine, at Sheridan, and have commenced a tunnel to cut the vein at a considerable depth. Pritchett & Eastridge have taken out several carloads of high-grade galena ore from the east end, which they have been working under lease. The Keystone is owned by H. D. Rossiter of Sheridan.

W. B. Millard of Pony has taken an eighteen months' lease and bond on the Kearsarge mine at Summit, and has started work with Supt. H. Ptomie to systematically develop the mine.

##### MEAGHER COUNTY.

Thos. Cruse is having a milling test

made of ore taken from his claim at Thompson gulch, near White Sulphur Springs. The ore is taken from a quartzite cliff face. A horse whim has been put in position and a shaft is being driven down on the lead. A diamond drill has also been installed to test the lode by boring. The trend of the lead is east and west and there are parallel veins and reefs of porphyry. There are also porphyry dykes running at right angles. W. J. Sweeney is Supt.

A mining stampede has been started to the Big Snowy mountains by the discovery of rich gold-bearing copper and sand carrying free gold. L. Penwell, who brought the news to Helena, says: "I was shown samples of the sand and it was full of pin heads of gold and was wonderfully rich. There was said to be a great quantity of it. The whole population of Martinsdale, Harlowton, Ubet and Garnall had gone up the mountains to look for the place, and the towns were almost deserted. Careless Creek is about 30 miles from Harlowton, which is the nearest place on the railroad."

##### PARK COUNTY.

Development in the Bear Gulch mine, at Jardine, has lately uncovered a new vein of high-grade ore. Plans are under consideration for building a 60-stamp mill, which, with the present mill of twenty stamps, would make eighty stamps. There is said to be enough ore in sight to supply it. The mill is to be built next spring.

##### SILVER BOW COUNTY.

(Special Correspondence).—The Alice mine at Walkerville—one of the original silver mines of the Butte district—is outputting about 600 tons of ore a month by leasers. The company which owns the mine is considering methods of treating the large tonnage blocked out above the 200-foot level by leaching. The ores—above the water level—comprise oxidized material carrying small values in silver and gold in an iron and manganese gangue. But below the level of the ores described above are large bodies of lead and iron sulphide, with about 18% zinc, carrying small values in gold, silver and lead, the whole material usually running about 35% silica. Numerous and various methods of concentrating these ores have been tried, but with rather unsatisfactory results. In trying to separate the iron from the zinc and eliminate the silica heavy losses are made, and other methods are being tried that may solve the problem, as the tonnage of this grade and character of ore in the lower levels of the Alice is said to be large. The Alice lode is about 200 feet wide between the walls, within which the ore runs in shoots, veins and chimneys through the wide ledge.

Butte, Aug. 1.

The Colusa-Parrott Co. have brought suit to enjoin over eighty farmers from diverting the waters of two creeks, contending that all water should flow to the smelting works without interruption. The ranchers have been using the water for irrigating. A temporary restraining order has been issued.

#### NEVADA.

##### LINCOLN COUNTY.

The Manhattan M. & S. Co., capital \$12,000,000, has been incorporated in New Jersey to take over the sixty-seven properties owned by the Pioche Con. Co. and others, to a total of about 100 mines, together with hoisting works, smelters, pumping plants and the electric light and water systems of Pioche. The undertaking calls for payment of \$1,000,000 within the next eighteen months and was promoted by A. B. Lewis of Frisco, Utah, New York people being associated with him. Work has already been started at several points and within a year, Mr. Lewis says, the new company will be working from 1000 to 1500 men.

H. A. Cohen, general manager of De Lamar's companies, says the mill at De Lamar will probably close down in August and before it is started up again will have many alterations, the most important of which will be the substitution of a "wet" for the "dry" process so long employed. The force of men at De Lamar at the present time will be reduced one-half temporarily. As soon as the wet process is installed it will start running on low-grade ore and 400,000 tons of tailings.

##### LYON COUNTY.

L. H. Rodgers, one of the Cuyahoga M. Co., operating near Yerington, says his company is about to establish a pneumatic cyanide plant at the Cuyahoga mill to work the tailings.

##### NYE COUNTY.

Shipping ore is accumulating on the dumps at Butler much faster than the teams can haul it to Sodaville. It is said 7527 sacks of ore await shipment.

W. H. Dickson and A. C. Ellis, Jr., of Salt Lake City, Utah, have bonded the Wandering Boy, Stone Cabin and Lucky

Jim claims at Butler, Tonopah county. The price to be paid is \$35,000. W. A. Wilson is manager.

#### WASHOE COUNTY.

Twenty-three men are at work in the Reno Star mine, near Reno. The principal work being done is in blocking out pay ore. The Bell shaft ore is being blocked out and the work of raising ore to the surface will be commenced in a few days. An electric hoist will be installed.

The Reno Chance mine has been incorporated. The mine is near the Reno Star and consists of the Eastern Star, Look-out, Isabella, Alturas, Great Northern and Dunlap claims. R. Eason is president, G. W. Perkins secretary and C. J. Frisch treasurer, with offices at Reno. A shaft has been sunk 115 feet on one of the claims. A contract is to be let to run a 200-foot drift from this shaft.

#### WHITE PINE COUNTY.

P. C. Weber, M. B. Garaghan, R. A. Riepe and W. Clements have bonded to Salt Lake, Utah, people five claims on Saw Mill canyon, near Ely.

#### NEW MEXICO.

##### RIO ARRIBA COUNTY.

The Belle Royal Copper M. & M. Co. has been incorporated by A. Royal, B. Royal and C. W. Murray of Pueblo, Colo.; capital, \$1,000,000. The directors are A. Royal, T. Kelly, B. Royal and C. W. Murray of Pueblo, Colo., and A. Royal, Jr., with office at Pueblo, Colo. The company will mine in the Bromide mining district, near Tres Piedras.

##### TAOS COUNTY.

It is reported that W. Fraser of Amizett has sold his group of mines to A. C. Twining of Asbury Park, N. J., representing the Copper Mountain M. Co., for \$125,000. A 100-ton smelter is said to be projected.

#### OREGON.

##### BAKER COUNTY.

The California mine, located in the Cable Cove district near Sumpter, has been sold by H. Cabell, J. Cabell, B. F. Cabell and W. F. Cabell, the original owners, to the Turnagain Arm M. Co., of Minneapolis, Minn. The price paid is said to have been \$60,000, and included with the California several other smaller claims. The new owners have announced their intention to expend a large sum in development work and improvement.

##### GRANT COUNTY.

(Special Correspondence).—The Intermountain group is in charge of Supt. Hahn, who is developing the property through a tunnel.

Near Alamo the Yellowstone group is being developed by Geo. J. Barrett, who has crosscut 350 feet to a ledge of ore and drifted thereon 100 feet. The crosscut extends 250 feet further to a second vein. The work disclosed quartz, talc and iron sulphides carrying gold values. Mr. Barrett is also doing some development on other claims near the Red Boy group.

The Climax, north of Granite, is being developed by the Eastern Oregon M. Co., in charge of C. R. Aldrin. A lower tunnel, now in 200 feet, is being driven to cut a vein that has been opened at a higher point.

The Buffalo, west of Granite, is operating with a small force and is in charge of R. T. Cox of Portland.

The Cougar, which has a 250-ton cyanide and crushing mill, ran several months last year, but is now idle. The Magnolia, in the same locality, is also idle.

Ten miles west of Granite, on the north fork of the John Day river, are the placer workings of the Thornburg Placer & M. Co., in which Dewey Bros., of Denver and Georgetown, Colo., are principally interested. The operations are in charge of Supt. W. S. Duncan, with A. Glenn as foreman. Their holdings extend over both sides of the stream for 3½ miles. The water for the hydraulic work is diverted from the stream about 4 miles above the principal operating point. The upper section is 2850 feet of flume, then 1½ miles of open ditch, then 8500 feet of flume, with a pressure of 250 feet from the lower end of the flume to the giants, of which there are two in operation. The gravel bars are stated to be from 25 to 40 feet deep. This company purchased the property two years ago and this is their second season's work. The company have a saw-mill 2 miles up the river which has furnished the lumber for flumes and buildings.

Sumpter, Aug. 1.

##### JOSEPHINE COUNTY.

Winningham & Van Gorder of Forest creek, near Grants Pass, are running a tunnel to tap their ledge 165 feet down and are now in 205 feet.

G. Garrett and F. Bachman of Gold Hill have bought the placer claims of Prof. Barnhart on Applegate creek.

G. E. Morse of San Francisco, manager of the Swayne M. Co., while in Jackson-

ville lately, made arrangements for the early starting of work on the ground which they have bonded of P. F. Swayne of Applegate.

D. S. Rae of the Klondike mine, on Louse creek, near Grant's Pass, reports that in sinking from the upper tunnel of the mine a rich shoot, from 2 to 4 feet in width, was struck at a depth of 80 feet.

A new placer mine is to be operated near Waldo by F. H. Osgood of Seattle, Wash., who has bought a large area of placer ground.

Stamps, concentrators, drills and other machinery are being installed at the Golden Wedge mine, on Regueriver, near Grant's Pass. This mine was for several years worked with an arrastra.

#### UTAH.

Mining dividends for July are as follows:

|                         |           |
|-------------------------|-----------|
| Cent. Mercur.....       | \$125,000 |
| Centennial-Sunsets..... | 50,000    |
| Daily-West.....         | 52,500    |
| Mammoth.....            | 26,000    |

#### BEAVER COUNTY.

The Morrison option on the Copper King group of copper-bearing locations, in Star district, near Milford, has been taken over by the Blue Bird M. Co., of which P. A. H. Franklin of Salt Lake City is president. The group, which consists of six locations, was bought by L. Morrison and A. J. Berles about a year ago, since which time they have been developing the ground so satisfactorily that the erection of a smelter is projected.

At the Hoosier Boy group, near Milford, which is operated on a bond by A. B. Lewis, seventeen men are employed drifting north and south on the 200-foot level on silver and lead ore.

The main shaft of the Milford M. Co., at Milford is now down 80 feet and is being equipped with a whim capable of sinking to a depth of 400 feet. Ores have been in the meantime uncovered in several openings on the vein through a length of 400 feet. P. S. Martin is manager.

#### BOX ELDER COUNTY.

The Pine Canyon G. M. Co., capital \$100,000, has been incorporated. A. R. Carter is president and W. E. Maddison secretary, with offices at Salt Lake City. The company owns the Mount No. 2, Emmer, Emmer Nos. 1 and 2, First East extension of the Emmer, Pine Tree and Pine Tree No. 1 claims, with a mill site and water right in Pine canyon.

#### GRAND COUNTY.

The International M. Co. of Beaver Basin has struck a fine body of peacock copper ore.

#### IRON COUNTY.

The Big Fourteen Co., composed of Salt Lake, State line and Cedar City people, are projecting a mill for their mine at State line. W. Dooley is superintendent at the mine.

#### JUAB COUNTY.

The Pharus Con. M. & M. Co. has been incorporated, capital \$800,000, with C. E. McCortick president and R. G. Wilson secretary and treasurer, with office at Salt Lake City. The company owns the Martin, the Malagany, the James G. Blaine and the Pharus mining claims, in the Tropic mining district.

#### PIUTE COUNTY.

The Twentieth Century G. M. Co., capital \$500,000, has been incorporated to operate the Miner's Dream, Smith & Weston and Ben Ton claims, in the Otto district. G. Morrow is president and A. Cain secretary, with offices at Salt Lake City.

#### SUMMIT COUNTY.

The Hawkeye-McHenry M. Co., capital \$800,000, has been incorporated to operate a lease and bond on the McHenry lodes Nos. 1 and 2 at Park City. The lease is for two years and the option price is \$50,000. H. D. Niles is president of the company and J. R. Walker is secretary and treasurer.

At the mill of the California M. Co., at Park City a 140-ton Huntington mill will be added to the plant.

#### TOOELE COUNTY.

Manager M. R. Hunt of the Utah Queen, Dry canyon, has bought of J. McRae and J. B. Hoeman of Tooele the old Rarrier mine, adjoining the Hidden Treasure of Dry canyon, for his company. Mr. Hunt will put a force of men at work on the property at once.

#### WASATCH COUNTY.

The Harwood M. Co. has been incorporated, capital \$15,000, to operate the Lost Boulder and five other claims in the Blue Ledge mining district. R. T. Kimball is

president and L. B. Wright secretary, with office at Salt Lake City.

#### WASHINGTON.

##### FERRY COUNTY.

In the Princess Maud the shaft is down 435 feet, and the 400-foot level, 650 feet below the surface, has been started. The ledge has an average width of about 4 feet. The values are much more uniform than they were at the 300-foot level.

The Butte & Boston mine, at Republic, C. C. Grebbs, superintendent, has developed the pay shoot on the 250-foot level. The drift is in 140 feet, and a sample from the face of the drift showed an assay value of \$78.24, with 10.25 ounces of silver per ton.

J. Young and associates, who have taken a bond on the Montana and two other properties at Meteor, are negotiating for some ground close to the Meteor and M. & W. claims.

On the Stray Dog work has been resumed in the shaft. Mr. Olmstead of New York is about to order a hoisting plant with a capacity to work down to the 600-foot level.

##### PIERCE COUNTY.

The Gold Crown Tunnel M. Co. of Tacoma has started work on a mile tunnel through Gold hill, near Summit, 75 miles east of Tacoma, which is expected to cut thirty-five veins. The face of the tunnel is now within 50 feet of the main vein in the Eva claim. Besides opening its own ledges, the tunnel company will open claims owned by other parties. The company has taken a water power sufficient to run compressors, drills, cars, a sawmill and other plant.

The Tacoma smelter is preparing for the treatment of a larger tonnage of copper ores from Alaska and from the coast of British Columbia. The new copper plant will reduce 300 tons per day to matte, and a converter plant is being put in to reduce the matte to blister copper. The Nahmint mine, on Alberni canal, on the west coast of Vancouver island, is to supply 150 tons of ore daily.

#### WYOMING.

##### CARBON COUNTY.

W. R. West, manager of the Carbon County M. & M. Co., Montana, has bought a compressor and other plant to do development work on a copper and gold proposition, 35 miles northwest of Laramie, toward Encampment. A tunnel is now 700 feet toward a vein, assays from which have returned high figures.

The smelter at Encampment has been started up and the ores of the Charter Oak mine are being reduced. This is the first smelter in the State of Wyoming.

#### FOREIGN.

##### BRITISH COLUMBIA.

The Prospectors' Exchange of Nelson says about twenty men are employed at the Enterprise, Slokan district, under Foreman McPhee. Machinery for the concentrator is on the ground.—The Rambler-Cariboo Co., Sandon, has bought the Washington mill from Mitchell & St. Jean and will set it up to treat the Rambler ore.—Good progress is being made on the iron property at Kitchener. Forty-five men are employed with diamond drills, making borings and surface pit work. The deposit has now been explored to a depth of 160 feet and the cores show a high grade of hematite iron ore.—There are between 200 and 300 men, mainly prospectors, in the vicinity of Cambarne, the new Fish river free gold camp, Lardeau district. The London & B. C. Gold Fields Co. employs thirty men at the Eva and A. F. Rosentenger, manager of the Rosenberger Syndicate, employs twenty more men on the Oyster and Cambarne groups.

Nelson, Aug. 3.

The Rambler-Cariboo has declared its fifth dividend of 1 cent a share, \$12,500, to be paid August 30, being the total dividends up to \$127,500. At the annual meeting at Rossland the old board of directors and officers were re-elected. A. P. McLaine, president; J. J. Humphreys, vice-president; and W. H. Adams, secretary, treasurer and manager. The lowest working in the mine is 700 feet deep on No. 3 level. The drift at this point is in 300 feet, of which 200 feet runs on the lead and is in solid ore. The smelter returns from fifty carloads of ore, practically all from this drift, gave 123 ounces of silver and 484 lead. A new hoist, additional compressor power, an electric light plant and a 15-ton concentrator, all to be run by water power, are being installed.

The returns for the month of June from the Ymir mine show an estimated profit on working of \$22,000, making the total net profit for the first half of the year \$180,512.

The June cleanup from the cyanide

plant at the Athabasca mine at Ymir yielded \$5872.

The Fern mine is to shortly resume operations after being shut down for over a year. It has been leased to R. Nicholls for ten years. The property is a free-milling gold proposition, developed and equipped with a 10-stamp mill and small compressor plant.

J. Russell, president and managing director of the Fairview Corporation, Ltd., has reorganized the company under the name of New Fairview Corporation, Ltd. Mr. Russell says: "We propose to dismantle the Tin Horn mill and put it up on the mill site of the Stenwinder mine. This mill is of 16-stamp capacity, having eight batteries of two stamps each. The company has also bought the Joe Dandy mill of ten stamps, which will also be taken down and removed to the new site. During the erection of the mill work at the Stenwinder will be advanced. We expect to treat \$4 rock and make it pay. With the showing we have in the mine, a large daily output should give a small margin of profit. If we find that with the twenty-six stamps we can make a success, the capacity will be doubled."

The shipments from Phoenix for the week ending Aug. 3rd were 8144 tons, being 4697 tons of ore from the Old Ironsides group; 1255 tons from the B. C. group; 80 tons from the R. Bell; and 2112 tons from the Mother Lode mine in Deadwood camp. Total boundary shipments for the year to date are 207,830 tons. For the first time the B. C. mine began shipping to the Mother Lode smelter at Greenwood last week. This ore had been going to the Trail smelter.

C. Livingston, manager Tyee M. Co. at Mount Sicker, Vancouver island, states that the body of ore which the Lenora people are working has been struck in the Tyee shaft. Now that the Tyee people have reached the ore the proposition for the establishment of a smelter at Osborne bay will be carried out. A smelter will probably be erected at Mount Sicker soon, as the Lenora is increasing its output.

#### MEXICO.

(Special Correspondence).—An option for ninety days has been taken by W. Farrell for New York people on the Esperanza mine at Parral, owned by J. Harvie and associates, at \$250,000, gold. This property is located in the Minas Nuevas district, adjoining the Palmito mine. In the Santa Ana mine at Parral a 3-foot vein of ore has been struck that assays 25 kilos and 600 grams per ton. The property belongs to J. Harvie and associates. T. E. Shurr has bought from C. Tunessi and associates the Reconpensa for \$21,000. Development work has been started, supervised by the new owner. There is at present some shipping ore on the dump.

Parral, Chihuahua, July 30.

A. F. Wuensch, manager of the Celera mines in Sonora, states that he is preparing to begin the erection of the concentrating plant at once. The mill is to be worked by water power of the San Miguel river.

#### RUSSIA.

It is reported that American and French capital are to operate a concession of 1100 square miles of gold, silver, copper and platinum-bearing mineral lands in the South Ural mountains, Russia. The tract is said to be part of the Cabinet possessions, the personal property of the Czar. Among those appearing so far in the transaction are G. Treadwell, a mining engineer of New York, and Paul Annasaff of St. Petersburg, Russia, one of the builders and at present an associate manager of the Transiberian railway.

##### THE KLONDIKE.

A London company has obtained a crown grant of a water right in the Klondike river to supply the hillside and bench claims in the district with water. The company is composed of M. H. O. Ewing and A. N. C. Treadgold of London, England, and W. Barwick of Toronto, Canada. In the rights granted it is stipulated that so far as possible they must bring to all claims in the country sufficient water to work them to the fullest extent. It is required that they spend not less than \$250,000 before December 31, 1902. Certain clauses of the grant protect the individual miner, and the charge which the company makes is limited to \$1 per miner's inch per hour (?). Work has already been commenced at the head works on the Klondike, to prepare for the main aqueduct.

##### THE TRANSVAAL.

The Turf Club bore hole at Johannesburg has struck the main gold reef at a depth of 4800 feet. The discovery, it is said, establishes a permanent gold industry for seventy years, and practically proves that there are additional deep levels equivalent to a whole line of outcrop mines.

#### Personal.

P. JOYCE, Supt. Bald Mountain mine, Sumpter, Or., is in Spokane, Wash.

G. BLAINE has been appointed Supt. Jumbo mine, at Buffalo Hump, Idaho.

J. S. CHILDS, manager of the Bully Chopp mine, Shasta county, Cal., has resigned.

LEWIS T. WRIGHT, manager Mountain Mines, Ltd., at Keswick, Cal., is in San Francisco.

R. M. JONES has returned to Cripple Creek, Colo., after some weeks' sojourn in California.

P. L. FEARNE, manager of the Jesus Maria mine at Parral, Chihuahua, Mexico, is in New York.

J. A. WALKER, Pres. Rosaria M. Co., at Guadalupe y Calvo, Sonora, Mexico, is visiting the mine.

H. N. GALER has been appointed assistant manager Miner-Graves Syndicate, at Grand Forks, B. C.

P. H. WISEMAN, manager of the Shannon Copper Co., Morenci, Arizona, has returned from New York.

C. CUMMINS is at Sheep Ranch, Calaveras county, Cal., engaged in constructing a large cyanide plant.

PHILLIP ARGALL, M. E., of Denver, Colo., is engaged in professional work in British Columbia and Canada.

G. ROBINSON, formerly superintendent of the Kendall mines at North Moccasin, Mont., is at Teller City, Alaska.

C. H. PEARCE, M. E., of Oakland, Cal., who has been in New York for some months, has gone to Nome, Alaska.

C. G. CARRUTHERS of Colville has been appointed superintendent of the Shelbyville Con. M. Co., operating two claims near Colville, Wash.

FRED BURBIDGE has resigned as manager Bunker Hill & Sullivan mine, Wardner, Idaho, and will visit England. A. Burch, late Supt. of the mine, has been made manager.

#### Commercial Paragraphs.

HENRY E. WOOD has enlarged his ore-testing plant at Denver, Colo., and added some new equipment.

ARMOUR & Co. have just entered their third order for Cross oil filters furnished by the Burt Mfg. Co. of Akron, Ohio.

"CARNEGIE ROLLING MILL, Manchester Locomotive Works, Boston & Main Railway Co., Fore River Ship & Engine Co., Navy Department, and almost every prominent maker and user of machinery are now using Jupiter steel," says Wm. J. Wilson, C. E., who is looking for a Pacific coast location.

THEO. HIERTZ & SON have removed their works from Park Ave. to 10th and Poepping Sts., St. Louis, Mo., where the possession of two acres of ground gives them better facilities and more room. Their plant is on the Oak Hill branch of the Mo. Pacific & Iron Mt. R. R., securing good switching facilities.

THE Hendrie & Bolthoff Mfg. & Supply Co. of Denver, Colo., are erecting a 175-ton concentrator for the Big Kanahwa Leasing Co., at Creede, Colo. The power will be furnished by water that flows from the Nelson tunnel, which will be applied to generators and electric motors. The Big Kanahwa Co. also handle their ore through the tunnel.

THE Gardner Electric Drill & Machinery Co. report the shipment of twelve drills from their Denver shop within the past week, four going to various Colorado mines, three to British Columbia, three to Australia, one to London, England, and one to Montana. They are building what will be known as their Intermediate drill, to weigh 250 pounds unmounted for general work.

THE water power on the Catawba river at Rhodhiss, N. C., is one of the largest in the United States, and will be utilized for cotton manufacturing and other purposes. The S. Morgan Smith Co. of York, Pa., recently shipped to the Rhodhiss Manufacturing Co. two pairs of 36-inch and one single 30-inch McCormick turbines, mounted in iron cases, with the necessary supply pipes, draught tubes, a complete rope drive, as well as head shafts, couplings, bearings and a 1000-gallon fire pump.

THE American Diamond Rock Drill Co. report as among recent sales shipments of their machines to Tennessee, Montana, Michigan, Mexico, British Columbia, Alaska, Cuba, the Philippine islands and Spain. One order to be shipped to Spain was an especially large and complete one, covering and including drills of all capacities, from 400 to 3000 feet, and with all styles of mounting. Expert men are usually sent out by this company to take charge of all drills shipped. Both in ex-

### "THE DANIEL BEST"

**50 Horse Power**

## TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, **50 HORSE POWER.**

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING COMPANY,
San Leandro, California.

THE COMMON SENSE WHIM

Is made of the best wrought iron and steel. Compact and light; can be conveniently moved, carried by pack animals anywhere. If accident occurs the deadlock saves the load. : :

SINKING PUMPS,

Indispensable in sinking mining shafts or pumping out flooded mines. Easily raised or lowered by cable or rope. Equipped with outside packed plungers. Handles gritty or dirty water. Operates bolted to shaft timbers or only suspended by cable at any angle. Packing glands external. May be adjusted while in motion. Removable parts hinged. Steam movement positive and simple.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

CRANE FITTINGS

ESTABLISHED 1855

Globe Battery Stem Guide.

PATENTED AUGUST 24, 1897.

RIGID, SIMPLE, DURABLE, EFFICIENT, ECONOMICAL.

No trouble to install. No keys or wedges to adjust. No alteration of mill necessary. Effect a saving in friction losses. Each stem can be removed independent of the others. Costs no more than wooden guides.

MANUFACTURED ONLY BY

GLOBE IRON WORKS, Stockton, Cal.

We Build the Truax Automatic Ore Cars.

The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot, (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tannage) making the leather **Water Proof**. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/2" wide by 1 1/4" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : : S. K. SNODGRASS, Denver, Colo. (The Windsor.)

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

ORE BUYERS AND EXPORTERS. MINING SUPPLIES.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the
MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

ASSESSMENT NOTICES.

CONSOLIDATED ST. GOTHARD GOLD MINING Company.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of July, 1901, an assessment (No. 19) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 113 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23 day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. N. SHOECRAFT, Secretary.

Office—113 Crocker Building, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1901, an assessment (No. 3) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 214 Pine Street, room 31, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23 day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—214 Pine Street, room 31, San Francisco, California.

THE BUTTE BASIN GRAVEL MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23rd day of July, 1901, an assessment (No. 3) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at his office, 35 Stuart Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23rd day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

O. E. HOLMES, Secretary.

Office—No. 35 Stuart Street, San Francisco, California.

THE CALIFORNIA DREDGING COMPANY.—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of August, 1901, an assessment of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, Room 56, 120 Sutter Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on TUESDAY, the 10th day of September, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of October, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

(Signed) SAM. W. CHEYNEY, Secretary.

120 Sutter Street, San Francisco, California.

DELINQUENT SALE NOTICE.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 22nd day of June, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

| Names. | No. | No. | Cert. | Shares. | Amt. |
|----------------|-----|-----|-------|---------|---------|
| John Finn..... | 23 | 500 | | | \$15 00 |

And in accordance with law, and an order from the Board of Directors, made on the 22nd day of June, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the secretary, at Room 801 of the Claus Spreckels Building, corner of Third and Market Streets, San Francisco, California, on MONDAY, the 19th day of August, 1901, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

EDWARD H. STEARNS, Secretary.
Office—Room 801, Claus Spreckels Building, San Francisco, California.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the AMERICAN OIL AND REFINERY COMPANY will be held at the company's offices, Rooms 322-323 Parrott Building, 825 to 855 Market St., in the City and County of San Francisco, on MONDAY, the 19th day of August, 1901, at 1:30 P. M., for the election of directors for the ensuing year and the transaction of such other business as may properly come before the meeting.

J. C. ANTHONY, Secretary.

THE CALIFORNIA D-BRIS COMMISSION, having received applications to mine by the hydraulic process from O. F. Sloan et al. in the Old Stiff gravel Mine, near Vallecito, Calaveras Co., to deposit tailings in Wade's Gulch; from W. C. Ruff and Manuel Loal, in the South Honcut Mine, in Yuba Co., near Bangor, to deposit tailings in South Honcut Creek; from Henry Hanley and Marcus Starbuck, in the Last Chance Gravel and Seams Mine, near Canyon, El Dorado Co., to deposit tailings in Big Canyon; and from Arthur R. Pride and Robert Bobb, in the Willow Placer Mine, near Bassett's, Sierra Co., to deposit tailings in Deer Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on August 19, 1901, at 1:30 P. M.

DELINQUENT SALE NOTICE.

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,

544A MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models, Tin and brasswork. All communications strictly confidential.

THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING. A 1-inch stream will furnish ample water for a 50-ton per hour machine. CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings. The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from $\frac{1}{2}$ to $\frac{1}{3}$ greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

WHAT OTHER PEOPLE SAY.

Report from "Wonder" Concentrator being operated by Cyclone Drill Company in connection with their prospecting drill at The Mining Congress:

BOISE, IDAHO, July 24th, 1901.

GENTLEMEN:—We have the drill shipped July 1st set up and in operation on High School lot in heart of city and are attracting more attention than any other one exhibit. I came here from the South to see ground where we have the first drill and pan sent out in operation. The drilling is very hard, but the machine is doing good work, and the pan perfect work. It saves everything. All the panning I have done after it, I have failed to find a color where the pan has been properly operated. The combination being new and the discharge from the drill very strong, some gold went over in the first two holes, but it was not fault of pan. From the holes put down after I got on the ground, the tailings do not show a co or, and I panned them thoroughly.

Yours very truly,

C. W. PURSELL.

The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its use, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for Illustrated Catalogue B8 to

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested
by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent Ameri-
can engine builders, who are good judges of lubricators. Many of these
have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use,
or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our
new catalogue, showing our full line, will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

THE BRETHERTON HOT BLAST.

APPARATUS FOR PYRITIC SMELTING. It saves fuel, increases capacity of furnace, im-
proves character of work, does not require a hot top causing volatilization like other inventions, fur-
nishes pure air heated without cost, can be attached to furnaces already in use, is an all around money
saver, built and used by practical, successful metallurgists. Write for particulars to

THE BRETHERTON HOT BLAST SMELTING COMPANY, Mining Exchange Building, Denver, Colo.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.
Yours truly,
W. A. NEVILLS, President.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best.

AMADOR CITY, CAL., Feb. 18, 1897.
Yours very truly,
THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

Anaconda Self Oiling Axles FOR MINE CARS.

Over 5000 cars equipped with these axles are being used by the Anaconda Copper Mining Co. in Montana, and large numbers are in use at other mines in the Western States. Axles are made to suit any gauge from 18-inch to 40-inch. Wheels of any type or size can be supplied. The wheel usually furnished is 12-inch in diameter with chilled tread, of form as shown in cut.

The Reducible Item.

The steady pressure from the necessity of making savings and economies somewhere in the costs of metal production, to offset the steady downward tendency of metal selling prices, has been the cause of many improvements in the mining and metallurgical arts. The enlightenment that finds its birthplace in necessity, dealing with the economics of mining, has clearly defined the line of division between production and consumption to be on the production side of the ultimate consumer. Everything that the ultimate consumer pays in one sum is costs from his standpoint. This same sum regarded from the other end consists of many items of separate flat costs, and running with these separate flat costs, one or more separate items of profit.

In the development of the business of mining, each of these items has in turn been taken into consideration by the producer, and the effort made to make in it the maximum possible economy and saving, primarily to maintain or increase the profit margin against the constantly decreasing sale prices. What may be termed the trade handling of the metal by middle men between the last producer, who by labor or material added real value to the metal, and the consumer, who puts the metal directly into reproductive use as capital, has been more or less largely eliminated, and an economy of interest on capital made by shortening the time interval between the taking of the metal from the mine and its delivery to the consumer. The entire sum so saved increased the profit margin at first, but in the end the competition of increasing production tends again to the wiping out of the profit margin and forces additional economies and savings.

At the mine the mining costs have received material reduction through the improvement in methods and machinery by which capital, which has been becoming cheaper, is substituted for labor, which has been becoming dearer. The metallurgical costs have received an even closer searching for reducible items.

In the aggregate enormous savings and economies have been effected by the development of processes by which all the metals of one ore, or the several metals of several ores, interacting, become all reduced and utilizable, and by the constant improvement in mechanical appliances permitting, as with mining, the substitution of cheaper capital for dearer labor. The metal manufacturing arts, long regarded as entirely separate industries from the metal mining and metallurgy, have been added to and combined with the latter to secure further savings and economies. Notably is this so in iron, in which the single

business now comprehends every step from the ore, fuel and flux in the ground, to the finished, finally consumable article. The same development is beginning in lead mining, in zinc mining, and in copper mining.

The marked feature of the economic changes in every item of these savings and economies in metal mining is the substitution made of cheap capital for dear labor. The labor cost, irrespective of the rate of wages, has not only been kept down, but it has been diminished. There has been a constant tendency to the cheaper production with the higher wages. What was observed long since as a law of English industry generally, has proven particularly true of the mining industry, which is distinctively American.

While it is by no means to be assumed that the limit of saving and economy has been reached in the general items of cost considered above, the margin of such saving and economy has been reduced well down to its ultimate minimum, and it would seem as if the one remaining general cost item—transportation—was "the reducible item" of the cost of metal production. The problem of freight cost in metal production is not new, and it cannot be said to be unstudied. Yet it has been an item, that, perhaps more than any of the others, has seemed a direct cost charge on the consumer rather than on the producer. The latter has only exceptionally given it the effective analysis that has brought results in savings and economies. In the iron industry and in the petroleum industry this has been done with exceeding skill and success. In the general metal mining industry, however, transportation remains what may, to the practical exclusion of all others, be termed "the reducible item." The consolidation of mining businesses has reduced time between production and consumption as a cost item. Invention and better technical skill have reduced the waste of material and labor cost items. There yet remains to be accomplished the reduction of space between production and consumption as a cost item.

THE Selby Smelting & Lead Co. of San Francisco have been exceedingly fortunate in the prompt catching of the thief who stole the \$280,000 of gold bullion early last week, and in the recovery of the gold. It appears that the robbery was the work of one man, an ex-employee. The stolen gold bars were cached by him in shallow water at the Vallejo Junction wharf, a short distance from the smelter. Confronted with strong circumstantial evidence, the robber finally confessed and indicated where he had hidden the gold which has since been recovered. Much of the credit for the discovery of the thief and the recovery of the gold is due to the energetic well-directed work of Mr. Alfred Von der Ropp, the superintendent of the smelter. Many detectives working on the case, stimulated by the high reward, made short work of its seeming difficulties, and will be well repaid for their success. For the Smelting Company the robbery has become an incident. Its business is going on exactly as if there had been no robbery.

It is reported that the last contract for water-wheel equipment for extensions to the Niagara plant has been given to a Swiss firm of engineers, presumably after a competition as to price with American manufacturers. The significance of the fact seems to have been overlooked. It is only one contract, but it would seem to indicate that the United States has not the uncontested lead in metal working it believed it had. The foreign bidder had the handicap of a high tariff, more costly material and freight. It will hardly be contended that wages which are in Switzerland not much below the American standard will offset this great handicap. Some of the difference must have come out of profits, the Swiss bidders being satisfied with less than the American. The incident is worth the consideration of our American metal manufacturers. Is or is not the attempt to get high profits driving away business from its natural channels? It has been notable in recent years the closeness with which competing bidders in metal constructions in the United States could figure their competing bids. In metal work now nothing has to be left to chance or guessed at. Yet incidents similar in kind to that of the Niagara water-power plant construction are not infrequent. Only recently bids being asked for a large stamp mill in California, the local manufacturers were underbid approximately \$100 a stamp head. There would seem to be no reason for such a great difference in heavy metal manufacturing unless it is in the respective ideas of what is a profit on metal working.

The Price of Copper.

The present price of copper—16 cents to 17 cents a pound—has been maintained for over thirty months. The question of the continued maintenance of the price is a matter of considerable importance to copper miners. The present price has not been fixed by the cost of production, but quite independent of it. The price was rapidly advanced in 1898 by men controlling a minor fraction of the production, but who appreciated earlier than other men in the business the commercial conditions. The consumption of copper for a number of years previously had been increasing more rapidly than current production without affecting the price. The use of the metal was promising to extend even more rapidly. The real commercial conditions which the men controlling a minor fraction of the production were the first to see, once the price of copper was advanced, could be seen by anyone. The question that is vital relates to the future maintenance of the present price or a figure approximating it.

The present price has been maintained for a period sufficiently long for it to develop its influence on production. Briefly stated, European mines have decreased in production and no new mines have been discovered. Mines in Asia, South America and Australia have not increased their production and no new mines that promise material increase in production have been discovered. Russia and Siberia undoubtedly contain copper deposits, but their utilization commercially is certainly ten years away—perhaps more.

In North America copper production has increased in the aggregate. A very large number of new operations have been undertaken and some are beginning to produce. Other new operations are being projected. The old established mines, excepting only those of Michigan, are the ones, however, that so far have made the great gains in production. The Lake Superior region has not developed anything in the way of richer deposits as a result of the increased energy of exploration. Poor deposits have been opened up for more extended working, and at present prices can increase production. Lower prices will wipe out profit margins which have been created solely by the higher prices, and the net result to the district will be a diminished production. In other districts in the United States, in Alaska, in Mexico and in British Columbia the gain in production is more permanent and established and will be less affected by a decrease in price. There are several reasons for this. Many new bodies of copper-bearing ore of enormous extent have been discovered. Other large deposits, supposed unworkable, have yielded to improved or different methods. The cost of treatment of sulphide copper ores has been reduced. More important, the ores all carry more or less recoverable gold and silver. Frequently the amount is so large that the recovery of the copper is paid for by the value of the gold and silver recovered. This element of value in gold and silver content should not be overlooked by investors in copper mining. The same condition that every other metal has had to meet—overproduction—copper cannot escape. The constant industrial and commercial tendency, toward the equalization of the margin of profit in all industries, will ultimately affect copper production. With a gold and silver yield from his mining paying the costs of production of the copper, the miner is insured against loss. Ultimately the principle of the survival of the surest paying mines may limit copper mining to these ores.

The production end of the copper industry seems, on the review of the mines of the world, safe to keep prices at their present high figure. Increase in production in North America for some years to come it would seem probable will be partly compensated by natural decreases in other countries, and partly by new uses for copper continuing to increase.

The weak point for the maintenance of prices is, it would seem, rather to be looked for at the consuming end of the industry. While uses for copper are extending, the high price of the metal is a constant stimulus to search for substitutes. The great use of the metal is in wire for electrical work. At the present price of 16 cents to 17 cents a pound, aluminum costing 35 cents a pound has been found commercially available as a substitute for copper. The

cost difference is not a large amount at these figures. A drop of a few cents a pound in copper would make aluminum much the more costly. But, on the other hand, cheaper aluminum would mean the immediate substitution of it for copper in wire for electrical work. Here is the danger point to the copper price. There is considerable room for a drop in the cost of production of aluminum. The cost of aluminum production by the present electric method is reasonably to be considered its minimum. Some other method may be developed that is less costly. This is, in fact, claimed at the present time by an inventor, who states that, on an experimental scale, he has produced aluminum at a cost not exceeding 7 cents a pound. If the claim be made good commercially, it is easy to see that aluminum would be the commercial substitute in electrical work for copper with the latter down to 5 cents or 6 cents a pound.

The reduction in consumption of copper by the use of aluminum for electrical work could not fail to reduce the price some and cut down production from some mines. On the other hand, a reduction in price would bring the cost of the metal within reach for many purposes for which steel is used now. So that while no sweeping down of copper prices is to be anticipated, it is good business for copper miners initiating new enterprises to consider them in advance on the basis of prices for the copper materially less than rule at present.

THE rapid increase of mineral production, under the stimulus of high profits from increased consumption during the last half dozen years, has quite generally resulted in wiping out much of the first high rates of profit, through production in its turn exceeding consumption. Producers, in order to sustain prices, besides the ordinary method of restricting production, now becoming increasingly difficult, are in many lines working to increase consumption. Zinc producers of Missouri and Kansas are experimenting with the manufacture of zinc shingles. It is a new use, but if they can be commercially manufactured it means the establishment of a new use for zinc that will absorb a large amount of production. Petroleum is being brought into domestic use in Oakland, Cal., as a substitute for coal. It is found more economical than the latter, and its general use, besides the economy to the users, will provide a steady consumption that will raise the sale price of the California production. The present price of petroleum at San Joaquin valley wells, 25 cents a barrel, could be trebled before it would call for a rise in the present retail price of the oil, \$2.50 a barrel, to Oakland consumers. The California fuel oil price problem is a comparatively local affair. The zinc production price is a matter of more general moment. The principle applied to sustain the price to producers is the same. Lead prices to producers already necessitate for that metal some of the same treatment through the originating of new uses by the producers.

OCCASIONALLY the comparison is made that some particular mine produces annually more gold or other metal than some other newer State or Territory which for the time is attracting the attention and money of the public. The object of the comparison is to suggest the argument that the particular spot where the one mine is, is better as a field for mining investment and enterprise than the newer territorial area with which it is compared, to the intended disadvantage of the latter. The argument intended to be suggested is not sound. In the first place, the single mine represents, ordinarily, many years of a past life, during which the facilities for its metal production have been created, and during which the adjacent prospects and abandoned claims that failed have been forgotten. Time is an essential element in the making of production of any mine or district. In a mineral bearing country the chances for big mines, large producers for long periods of time, are increased in proportion to area. It is not unreasonable to infer that the same time given to the development of the newer territory will produce the same desirable result as exists in the older. The attention and money of the public go to the newer district because the chances it offers for personal gain are believed to be the better. Other people are more or less correctly believed to have all there is of gain to be obtained in the older district of the great mine.

Concentrates.

THE energy represented by what is termed the friction head of the water flow in a pipe is dissipated as heat.

IN the California oil fields the topography seems to have little or no effect so far as the workable value of the deposit is concerned.

IN stamp mill practice one way of obtaining a high duty per head is by throwing all possible of the work of crushing on the rock breaker.

THE lead production of British Columbia, sold at London prices and finding its market in the ore in Europe, is compelled to pay half of its value out in freight charges.

AFTER using No. 1 powder to spring holes for blasting the hole should be washed out before loading another charge into it in order to avoid the danger of an explosion through ignition by a spark left by the first shooting.

THE Supreme Court of California has lately ruled in a case coming on appeal from Tuolumne county that where there is no penalty attached for the violation of any local rule or regulation of a mining district, it does not vitiate a location.

THE windlass and bucket as a means of taking spoil out of a mine shaft are practically unknown in Siberia. The miners in working out through a shaft shovel the spoil from one platform to another in the shaft, 4 or 5 feet at a lift, till the top is reached.

TO WELD small shafting in a blacksmith forge: Upset the ends to be joined and split each down far enough to put in a double wedge piece; put all together in a hot fire, driving together while soft in the forge; work on the anvil with top-and-bottom swages.

TO WELD malleable cast iron or malleable cast steel, a good flux is composed of equal parts by weight of pulverized borax and cast steel filings, thoroughly mixed and used in quantity. The anvil should be heated up to 150° F. or more to prevent the chilling of the metal by contact.

THE easiest and most economical way to increase the horse power of an engine is to increase the steam pressure in the boiler, provided always if the boiler will stand the increase. Every added year of life of a boiler reduces by a measurable quantity its ability to withstand pressure with the proper safety factor.

AS A substitute for a windlass, a hand winch is frequently desirable in sinking shallow shafts. A good ratio between the pinion and the gear is a 5-inch diameter for the former and 12 inches for the latter. There is no uniformity in practice—either 3 or 4 inches for the pinion with 12 for the gear being indifferently used.

"CONCENTRATES" is largely attempts to correctly answer questions weekly received and state minor technical details of engineering, mining and metallurgical practice. Many novelties in detail of mechanical construction or detail of operation are being originated by miners and mill men that are useful general information.

STEEL WOOL consists of sharp-edged threads of steel, which curl up like excelsior, though finer. The various grades are used as substitutes for sandpaper in smoothing and cleaning surfaces for painting or varnishing. The steel wool for moldings and irregular surfaces is superior to sand paper, as it fits into crevices and irregular surfaces better.

IRIDOSMIUM is worth from \$6 to \$10 per ounce, according to quality. Iridosmium is tin-white in color, heavier than gold, occurs usually in small scales or grains, which in panning hang back of the gold. When concentrates are used, the very fine metals often hang behind in streaks, which in mass are of a brownish-red or leaden color and creep along the concentrator.

THE temperature to which drill steel is heated before tempering may or may not affect the temper. It depends somewhat on the steel itself and somewhat on the rapidity of cooling from the heat temperature to the temperature at which the tempering is begun. Different steels require to be worked under the hammer at different heats, some at white heat and others at as low a temperature as possible.

THE smelting ores of the Le Roi and other Rossland, B. C., mines contain less than 1.3% of copper, the chief value being in gold. These ores are not given any preliminary wet concentration, but are roasted and smelted to a copper matte. The smelters, in settling for the copper, do not deduct 1.3% flat from the wet assay determination, as that would leave no copper for the mine. The practice is to pay for 70% of the copper as determined by wet assay. Actual losses in smelting are found as low as .2% and not exceeding .3%.

THE United States courts have made a ruling that where a foreign corporation was the real owner of a mining claim, a patent, obtained to it by a citizen of the United States for the use and benefit of the foreign corporation, through false representation to the U. S. Land Office that the citizen was the owner of the mine, is void. The foreign corporation does not, however, forfeit the mine, but is compelled to do assessment work on it just as if no patent had issued. A failure to do the assessment work forfeits the claim and it is then locatable.

ORDINARY cast iron can be welded, though the term

united is more exactly descriptive, as the pieces are joined by a process of casting, rather than by hammering together. Numerous holes are bored in the pieces to be united and they are secured together. About the break is placed a quantity of pig iron filings, wrought iron filings, steel filings and borax to form a flux. Lute with clay to hold the metal and heat in forge until the filings melt and fill all the cavities. Let it remain in the fireplace until thoroughly cold, when it can be removed and cleaned.

WHERE an agricultural or railroad patent has issued to a tract of land which, at the time the land was filed on or the grant attached, was known to contain a lode of valuable mineral, the patent does not take the lode and it remains locatable. The limit of width of side ground that could be taken by location would seem to be only 25 feet on each side of the center line of the lode. The patent obtained under such conditions would have been based on fraud, and void as to the lode, which should have been excluded from the patent by a segregation survey.

IN starting a fresh drill into a hole already started it should be struck lightly with the hammer until the bit is seated true in the bottom of the hole. The corners of the chisel edge of the drill round off as it is used so that the bottom of a hole is not up to the gauge of the bit of the fresh drill, which then seats on being put in only on the corners. Striking the drill hard when the chisel edge is not full seated is apt to split off the corners and may break the bit off entirely. Striking light blows chips off the rock under the corners till the edge seats full on the bottom.

THE water from a copper mine, where it contains not less than .05 of 1% of copper, should pay under treatment for the recovery of the copper. This small fraction of a per cent is .000425 pound of copper to one gallon. A miner's inch of flow of water daily would contain 68 pounds of copper, which would be recoverable as copper cement by the consumption of 112 pounds of scrap iron. The copper cement, at 12 cents per pound, would be salable for \$8.16. The cost of the scrap iron should not exceed \$1.12, thus leaving about \$7 a day as the net value recoverable from 1 inch of mine water containing .05 of 1% of copper.

THE payment of 95% of the assay gold value of ore, reckoning the gold at \$20 per ounce, is a payment of only 91.92% of the actual coinage value of the gold. Some smelters pay higher percentages for the gold when the assay runs over two ounces to the ton. As much as 98% on the \$20 an ounce valuation is paid where the ore contains over five ounces of gold to the ton. This 98% is 94.84% of the coinage value of the gold. Even with this there is a profit margin in the difference which with five-ounce ore amounts to \$5.35 a ton of the ore as compared with \$3.25 a ton of the ore when it only carries 1.95 ounces per ton.

WHETHER or not liquid chlorine will serve the purpose of chloride of calcium in bleaching can be best determined by experiment in a special vessel. The chlorine in 160 pounds of the chloride of lime weighs 100 pounds. The chlorine gas is the bleaching reagent. Liquid chlorine is chlorine gas compressed at a pressure of 200 pounds to the square inch. It is put up in steel drums which weigh gross 300 pounds and contain 115 pounds of the liquid chlorine. A drum is 5 feet long and 10 inches diameter. Liquid chlorine is supplied by Mariner & Hoskins, 81 Clark St., Chicago, Ill.

REFERRING to a milling test of ore from a mine, a "mill run" and a "mill test" are not precisely the same thing. The "mill run" refers to the total ore crushed during the usual commercial time interval between battery clean-ups. At the least, it is a test of a number of tons of ore under commercial conditions. The "mill test" is a laboratory experiment following the sequence of operations and methods of a mill run, but without the appliances and using only a few pounds or hundred-weight of the ore. The results obtained in the laboratory are not necessarily conclusive as to what the commercial mill run will accomplish.

THE Supreme Court of California has ruled that if work is resumed on a mining location but not completed to the amount of \$100 before the first of January arrives on which forfeiture would occur, the claimant by continuing the work into the new year, and working continuously until the \$100 value of work is completed, protects the claim against forfeiture. It is not required that assessment work shall be done on Sunday to make the work continuous, as contemplated by the statute. The work so performed, however, is only valid for the year it was commenced and does not count for the year in which it was completed.

BABBIT METAL, as originally made, is an alloy composed of eight parts refined antimony, four parts copper and ninety-six parts tin. Ordinary soft lining, called babbit metal, is frequently made of four parts lead and one part antimony. Old type metal used for lining consists of two parts lead and one part each of tin and antimony. Frequent heating results in changes of the ratio of the metals in the alloy, oxidization going on at different ratios. To prevent oxidization, protect the melted metal from the atmosphere. A covering of dirt will do. The coating of oxide that forms first is some protection. Pulverized charcoal, with a little salt and soda, is perhaps the best protection.

THERE is no difference in economy of use between corresponding grades of American and English drill steel. In drill steel the miner can depend on getting just what

is paid for. The differences between drill steels are frequently due to nothing but the conservatism of the mine blacksmith, who only knows one brand of steel to be good—all others are bad. The real difference between two drill steels can be measured by use. The same drillers in the same mine opening should have records kept of the number of inches drilled, and of the number of drills sent to the shop. From these two records the average number of inches drilled by each drill of the lots compared can be determined. The steel that averages the greater number of inches drilled per piece is the best.

TO COOL WATER by compressed air, take the cold, expanded air after it leaves a cylinder in which it has performed work, and conduct it through a pipe or coil of pipes immersed in the water, to be cooled before discharging it into the atmosphere. Another method is to discharge the air from the cylinder through a chamber holding vessels containing the water it is desired to cool. Ice can be made by either of the simple means suggested. Compressed air which has not done work in a cylinder, but is simply released into the atmosphere through a valve, in expanding does its work in friction against the atmosphere into which it is discharged, and this energy is almost instantly converted into heat. No cold can practically be produced in this manner. In expanding in a cylinder under load, the compressed air at the atmospheric temperature doing work uses up heat to a corresponding amount, which is not replaced through the walls of the cylinder. It has thus a temperature when discharged less than the temperature of the atmosphere, and proceeds to absorb heat from the nearest bodies containing it. These bodies thus have their temperature in turn reduced. This is the principle applied to cool water or make ice, as desired.

JUST what causes checking or cracking in drill bits is hard to say in any particular instance. Sometimes it is the blacksmith; other times the water used for tempering and cooling. A third set of causes, however, is undoubtedly in the steel itself, due to defects in the manufacture. When a piece of steel is heated red hot and plunged into cold water to temper or cool, tremendous strains are set up within it. The outer portions are cooled instantly, and, of course, shrink, the still red hot interior portions yielding to allow this. But when the interior portions of the piece cool and shrink, the hardened outer portions resist the shrinkage, and stresses are set up in the piece that it yields to, either gradually or all at once. If the latter, the steel cracks and breaks soon after being withdrawn from the water. With this the original quality of the steel seemingly has much to do. Each particular grade requires its own special handling to get the best results and avoid the inherent weaknesses. To prevent the cracking, the effect of plunging in the water should be tested with the steel at different temperatures when plunged, and tested with different degrees of chilling before removal from the water. Careful testing will most likely discover the position of the weak point in handling and suggest the treatment that will avoid it.

THE problem of concentrating native quicksilver from a soft shale or schist—the former rather than the latter, as the phenomena of metamorphism which would have made the latter from the former would have closed it against free quicksilver—depends to some extent at least on the physical condition of the native metal in the rock. In California many of the mercury-bearing lodes are on the contact line of the older metamorphic rocks with younger sandstones and shales, which unaltered, contain more or less bituminous oily matter. The original mercury mineral was in these localities most probably cinnabar. Native quicksilver is most probably the result of a natural secondary distillation of the cinnabar. The heat which would disassociate the cinnabar and sublime the quicksilver from the sandstone or conglomerate, where the cinnabar was deposited, into the shale could be produced from several natural sources: the oxidization of pyrites in the shale for example. The same heat that sublimed the quicksilver would distill the bitumen in the same formations and both could and probably did deposit together. The minute globules of the metal could thus easily become more or less fouled by the bitumen or oil in the shale and will not run together and collect by washing. If the shale or slate contain a commercial quantity of the metal and it is in this condition, fouled by bitumen, the method of roasting and sublimation would seem best to be adopted. It would seem as if a continuous operating furnace could be devised for this ore-bearing native metal, which distills over at a lower temperature than the metal from cinnabar. If a wet method be possible for the concentration a very thorough preliminary testing is necessary to determine the place in the rock of the metal. If wholly in the seams, it may be that bank blasting will free it so that the deposit can be economically handled by hydraulic lifting through sluices and undercurrents. The larger the rock fragments can wash and give up the quicksilver the better. Slumming or sanding of the wash would carry off the metal. Undercurrents should be provided with as low a grade as the nature of the material will permit, and with mechanical arrangements to prevent the riffles from packing or sanding. The sluices should not be expected to make much saving. If the quicksilver is in the body of the rock a mechanical crushing before washing is indispensable. Anyway, after all "Concentrates" can say, the problem is still one only to be finally answered by the engineer who has the opportunity to examine the deposit.

Vein Definition.

In the recent trial of the Pennsylvania G. M. Co. vs. The Grass Valley Exploration Co. litigation in the U. S. District Court in San Francisco, over conflicting claims to a mine at Grass Valley, Cal., Ross E. Browne, mining engineer, as an expert witness gave testimony for the Pennsylvania people relating to the geological questions involved. In the number of this paper of August 3 a general statement of the case is made. A summary of the opinions and definition of the lode phenomena as they are as interpreted by the expert geologists' witnesses for the Grass Valley Exploration Co. will be given later. The following is a summary of the definitions and opinions submitted by Mr. Browne in his language as given in the course of his testimony, together with copies of the diagrams made to illustrate the definitions:

Synonymous Terms: We all realize the importance of using the terms lode, vein and ledge synonymously as used in the Acts of Congress, but it is difficult for the miner to avoid reverting back to older customs, and he very commonly speaks of different seams of quartz in the same lode as separate veins—e. g., as the foot wall vein and the hanging wall vein, maintaining, at the same time, that they are both within the boundaries of a single lode or vein formation.

It is owing to the lack of precision among miners, and to local differences in phraseology, that there arises so much confusion in definitions.

Ideal Type: The ideal type of vein is a plane fissure in the country rock filled with ore-bearing material. But it is well known that complications are the rule, and this definition is altogether too narrow for general use.

Mineralized Zone: A current definition of more recent date is "any mineralized mass of rock in place lying within clearly defined boundaries," or, still more recently stated, "within definable boundaries." This definition, like all others, is understood to permit the inclusion of so-called horses or masses of unmineralized country rock, partly surrounded by branches of the lode. This is a pretty broad definition—it does not prescribe the element of fissuring, and is more liberal than required to describe the Pennsylvania vein.

Complex Fissure Vein: The vein, as we commonly find it, is more fittingly described as the ore-bearing filling of a single fissure or of a system of interconnected fissures in the country rock. It may be complicated by the attachment of irregular ore bodies due to impregnation or metamorphism of the wall rocks, or to the filling of cavities other than fissure openings. It must culminate in its upward course in a single apex. It must preserve its identity throughout, and this means that it must maintain its continuity unless interrupted by subsequent faulting.

Boundaries: There must, of course, be boundaries or lateral limits to the lode. These may be regular or irregular in form.

Examples of regular form we find in the foot and hanging walls of a single fissure vein, or of a mineralized zone with sharp changes of formation on either side.

But such walls are not essential to the existence of a lode. For example, the irregular forms of impregnation and replacement veins often have for their boundaries the somewhat indefinite limits of mineralization.

A complex fissure vein has many walls, and may have either simple or complex boundaries, according to the structural outline.

- (1) Regular boundaries—plane fissure. (2) Regular boundaries—mineralized belt. (3) Fairly regular boundaries—complex fissure vein. (4) Irregular boundaries—complex fissure vein. (5) One regular, one indefinite boundary—impregnation or substitution vein. (6) Two indefinite boundaries—substitution impregnation vein. (7) Complex boundaries—complex fissure vein—Pennsylvania vein.

PENNSYLVANIA VEIN.—In the case of the Pennsylvania vein we have the complexity of fissuring. There is also some ore in the included masses of country rock due to impregnation. These masses have been altered and softened by percolating waters, and are traversed by many small fissures filled with ore-bearing material, constituting irregular ore bodies.

I imagine that the values are mainly in the small fissure fillings. However, it matters little what the values are due to; there have been large masses of such material stoped in this section.

There are no complications in other respects.

No Faulting: There is no complication due to displacement or faulting; the original continuity of the fissuring is still maintained.

No Intersections: There are no complications due to the intersection of veins. All branches are apparently contemporaneous in origin, and when they come together they form junctions like the confluence of the forks of a river.

A possible exception to this rule may be noted in connection with the so-called crossings. They constitute a series of small, almost vertical fissures crossing and cutting through the east and west dip fissures on entirely contrary courses. They are small and barren, as a rule, carrying frequently a little clay and rarely a little quartz. In no case that I know of has one of them been mined for ore in the Pennsylvania mine. Their effect on the vein is somewhat obscure. They do not fault the vein, but frequently the vein bends and steepens a little in passing through them. I shall not attempt to attach any significance to these crossings.

Country Rock: The country rock of the ground in dispute is wholly granodiorite—a rock very similar to granite. For all practical purposes we may call it granite, as the miner does. We may, then, add that there are no complications due to changes of formation.

Definition of Pennsylvania Vein: The Pennsylvania vein may now be defined as the filling of a complex of interconnected fissures in a homogeneous mass of country rock, the various parts being of contemporaneous origin and culminating upward in a common apex.

This vein apexes and continues downward several hundred feet, as a comparatively simple fissure vein; thence downward it grows more complex, but persistently maintains its identity. It is, apparently, more simple again on the bottom level.

Common Apex: The term "common apex" requires explanation in connection with my designation of this complex mass as a single vein or lode. Referring to the red color on the model representing the Pennsylvania vein, I am strongly of the opinion that, starting from any important point of development on the lower levels, a branch of the vein is traceable upward along a continuous line of mineralization, or of vein matter, through underlaps, east dippers and overlaps, to the Pennsylvania apex. It is not always possible to make such tracings through the present openings. There would be required a ruinous amount of dead work to enable such a thing, but the continuity is pretty generally indicated where the development is wanting.

There is one section of the mine where for a short distance we must go downward on an east dip in making the tracing to the apex—600 stope. But even here I believe that more complete development would disclose an upward connection with the overlap.

Departing Seams: There are many fissures or seams departing from this main line of ore bodies on divergent courses. These weaken and pinch out, or, if not sufficiently developed to exhibit this as a fact, the indications are definitely that way. These departing seams most commonly dip downward, or, if they start upward, they are apt to turn over and ultimately dip downward. Still, there are doubtless some of them which persist in an upward course, and, dying out in the country rock, have blind apices of their own. I must, therefore, explain that in speaking of the apex of the vein I treat these as insignificant offshoots or spurs, and not as separate branch veins.

THE EAST DIPPERS.—These east dippers, or east droppers, have about the same strike as the west dip fissures, but a contrary dip. They characteristically

connect two west dip fissures without cutting across either. They flow from one to the other. In no case

that I have seen do these east dippers cut through a strong overlap or underlap west fissure.

Steps: A striking feature of this mine is the part these east dippers take in leading to a stepping down from an overlapping to an underlapping west dip fissure. It is an unusual occurrence, so far as my experience goes, but there is nothing strange about it, any more than in many other cases. It is the natural result of the lines of weakness and the lines of strain; hence the lines of fissuring in this particular section.

There are certain sections of the mine where, if we follow the main fissure downward on its westerly dip, we find it flattening, weakening and pinching out; but, before pinching, there fall from it a series of east-dip fissures which connect below with an overlapping west-dip fissure. This underlap flattens, weakens and pinches out on its upward course, but on its downward course it strengthens and becomes a strong ore-bearing vein.

Step Faulting: The stepping down of veins by means of a system of step faulting is a familiar occurrence in some mining districts.

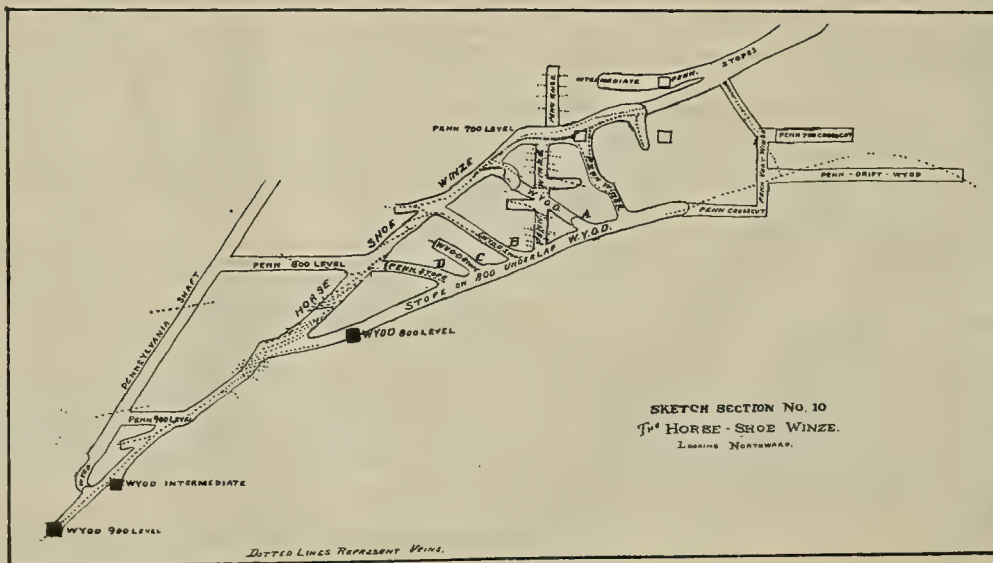

In that case the vein is cut by a series of later fissures. The masses of country rock slip on these later fissures and displace or fault sections of the vein. Such an interruption of the continuity often leads to difficulty in establishing the identity of the parts.

But the case we have in hand, although perhaps somewhat similar in effect, is very different structurally. There is no faulting in the Pennsylvania section; no displacement of the country rock. The channel through which the mineralizing solutions passed is simply complicated by this network of fissures. Its continuity as a channel is not disturbed; the continuity of the vein is definitely maintained.

Stop Sections: The following sections, Nos. 1, 2 and 3, taken at points shown on the map and model, will illustrate the actual detail of this stepping down of the vein.

Horseshoe Section: I will now refer to a section where a similar occurrence is repeated on a larger scale. I refer to the horseshoe winze section of the Pennsylvania 700 level down to the W. Y. O. D. 800 and below. This is where the two companies came directly in conflict in the stoping of large ore bodies. The overlapping fissure of the Pennsylvania vein has been stoped downward to a point where it flattens and pinches out, leaving a number of large east dippers and innumerable small streams which carry the quartz down 40 or 50 feet or more to a large underlying west dip fissure. This underlap fissure again shows

the same characteristics as in the smaller sections already exhibited. It flattens on its upward course and weakens to a barren seam. It strengthens on its downward course and becomes the great ore-bearing fissure of the lower levels. In the section between the overlap and underlap there is such a complication of east and west dip seams that a considerable part of the intervening mass constitutes a body of low-grade ore. How much of it contains value to pay the expenses of mining and milling I do not know; I made no tests to determine this. A part of the included masses is impregnated with sulphurets, which doubtless contain some gold independently of the quartz seams, though I presume they are poor.

The channel and the vein are continuous through this complex of fissures; the ore can be tested—in fact, it has been stoped continuously along various lines from the overlap to the underlap fissure; the lines are zigzag, but without a break.

This underlap fissure in its upward course, the moment it leaves the east dippers connecting with the overlap, ceases to carry any ore or quartz. It continues as a barren seam in hard country rock, flattens and weakens as far as pursued. It is about the shape of the inverted bowl of a spoon, and rolls from a west to an east dip.

In my judgment, it will gradually pinch out if followed much farther; in fact, it was followed upward on one dip line to a point where it joins a flat east or north dipper and pinches out absolutely.

THEORY OF FORMATION OF THE VEIN.—Regarding the theory of the formation of these veins, I do not think it of much importance—the facts as we find them concern us more directly. However, it may be well to give in outline what I adopt as the currently accepted theory.

The country rock was first fissured and fractured—some of the fissures reached to great depth, and tapped a deep-seated source of mineralization, from which solutions arose, circulated through the fissures, deposited the quartz with its gold contents and finally escaped to the surface.

In some recently published discussions on the subject, I note the claim that descending and horizontally circulating waters often take part in the formation of the vein. But it makes little difference whether wholly ascending or partly descending, once conceive the mineralization to be due to the circulation of solutions through the open channel prepared by the complex fissuring, and there is no more difficulty in recognizing the complex than the simple portions of the deposit, as inseparable parts of the vein as a unit. Concerning this unity it seems to me the only legitimate question is? "Do these interconnected parts apex separately or together?" I have already expressed my opinion in the matter—they join and apex together.

METALLURGICAL PROCESSES which involve the use of calcium carbide as the reducing agent, possess an especial interest due to the fact that they are, in an indirect manner, electro-chemical, for the energy used for the reduction is as truly electrical as though the effect was produced directly by electrolysis, instead of indirectly through the medium of the carbide furnace. Hence a discussion of such processes always involves the question of relative efficiencies as between fused bath electrolysis and electric furnace reduction—a question which generally solves in favor of the furnace. This question is raised but not answered by a patent recently issued to Henry Spencer Blackmore, of Mount Vernon, N. Y., for the reduction of aluminum compounds by the reaction therewith of a carbide. Mr. Blackmore finds that aluminum oxide is reducible by aluminum carbide with the liberation of the metal of both reacting bodies and in accordance with the equation $Al_2O_3 + Al_4C_3 = 5Al + 3CO$, the reaction being simply analogous to that employed by M. Moissan some years ago for the preparation of metallic chromium. If, however, the oxide and carbide of aluminum be employed in the solid state, it is found that the aluminum is either volatilized or so distributed through the residual charge as to render its collection impracticable, and, accordingly, it is proposed to suspend or dissolve the oxide and carbide in a molten bath, which remains inert with respect thereto, and which so reduces the temperature of the reaction and so alters the character of the medium as to permit the liquid metal to be tapped off. Two procedures are described: In the first, a mixture of cryolite and lithium fluoride is fused, and the oxide and carbide of aluminum are alternately added, the reaction occurring readily, it is said, and the aluminum separating freely. In the second, oxide of aluminum is added to the bath and calcium carbide then introduced, the effect being to produce aluminum carbide within the bath by reaction between the cryolite and the carbide of calcium, the aluminum carbide then reacting with the oxide present to yield the metal. The calcium fluoride formed interferes to no marked degree with the operation, and in the early stages serves to promote the fluidity of the metal. Eventually, however, the bath must be regenerated or renewed. Mr. Blackmore is authority for the statement that he has succeeded in producing aluminum by reduction by calcium carbide, on an experimental scale, and at an expense not exceeding 7 cents per pound.—Electrical World.

Gallows-Frame, Pinos Altos Co., Chihuahua, Mexico.

of the Pinos Altos Co., Ltd., at Chihuahua, Mexico. The depth of the two-compartment shaft is over 1000 feet. The frame, though of timber, using very few sticks, is so constructed that in use it has proven to be exceedingly stiff and free from vibration.

By a FRENCH PROCESS wood that has been impregnated with magnesium sulphate is said to become fireproof. Lead electrodes separated from each other by a sailcloth diaphragm are used in the process, which is electrolytic. A direct current of 110 volts is passed through the wood, extracting the sap and replacing it by non-inflammable salt. The rate of energy is about half an electric horse power at twenty to thirty volts per cubic meter. The treatment of the wood lasts about forty-eight hours. It is claimed paving blocks have been successfully manufactured by the process.

The Sulphide Ore Problem.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by JAS. W. WORSEY.

Having briefly reviewed the sulphide ore problem, so called, I here present a description of a method which I have originated—one which any chemical experimentalist can verify for himself. Possibly he may not make a big success at first; but practice, which is so needful in chemical and metallurgical work, will soon convince him of the feasibility and value of the process. The several steps of the process are as follows:

(a) Calcination of the crude ore until sufficiently porous and the sulphur contents are reduced to about 5%.

(b) Finely powdering the calcined ore.

(c) Mixing with about 2% commercial nitrate of soda.

(d) Boiling with a given quantity of dilute sulphuric acid of about 1.450 specific gravity until the bulk of the lead and zinc are converted into sulphates, with utilization of the escaping gases for the manufacture of sulphuric acid.

(e) Roasting the plastic mass in a closed furnace, with addition of an oxidant, if necessary, until all iron present is in the ferric state.

(f) Dissolving out the zinc and copper sulphates and other soluble salts present in a weak sodium sulphate solution, leaving the iron, lead, silver, gold, etc., and other substances undissolved.

(g) After removal of copper, if present, precipitating the zinc by H_2S , or by lime and volatilization as oxide, the residue being utilized for fluxing the non-volatile residues.

(h) The residues of the dissolving vessel to be smelted in the well known manner for the recovery of the lead, silver and gold.

This is a fair outline of the course of procedure, and any reader so desirous may make an experiment in the following way:

Take of the calcined zinciferous ore finely pulverized, say, half a pound, put same into a leaden or other acid-resisting basin, shaped like an evaporating basin, and heat on a sand bath; mix through the ore the quantity, 2%, sodium nitrate, and add about four

ounces strong sulphuric acid, to which water has been previously added to reduce same to 1.450 specific gravity, carefully stirring the ore from time to time, and finally boil. When the ore becomes pasty remove same and transfer to an iron ladle, or other like vessel, and roast carefully—the heat hardly to reach dull redness—until all vapors have disappeared. If iron is present in a notable proportion, then let it be converted to the ferric state by an admixture of quicklime and niter, in the proportion of 90% of the former to 10% of the latter, varying the amount according to the quantity of iron present, and let the whole be well stirred until the reaction is completed, when it may be withdrawn from the fire and allowed to cool. The treated ore may be boiled in water containing a little sulphate of soda; but, if the quicklime and niter have been added during the muffle roasting, then there will be sufficient of this salt in the ore to

answer the purpose. The boiling need not occupy more than twenty minutes, when it will be found that the bulk of the sulphates will be dissolved out of the ore and the solution filtered; the copper, if present, may be dissolved by zinc, the clear liquor taken to another vat and the zinc precipitated either by H_2S gas, as a sulphide, the cream of lime in the usual way and the dried precipitate treated in a special furnace to sublime the zinc as oxide. Sometimes a second boil may be requisite, treating the resulting solution as before. The ore, after drying in the ordinary way, may be smelted for the lead, silver and gold in the common method for silver-lead ore. The amount of extraction will vary with the skill of the experimentalist. With the writer it ran: Zinc, 60%; lead, 80%; silver and gold, 96%.

In practice a furnace, after the construction of those used in the manufacture of sulphate of soda, may be used, and for the dissolving of the solubles therefrom an agitating apparatus as designed by me is the proper device for this purpose. It is supplied with high pressure steam and cold air when required, has tilting gear and is capable of treating one or two tons per hour, according to size, replacing the old-fashioned leaching plant used for this purpose.

The Locomobile.

The locomobile is a self-propelling carriage which is, as its name would suggest, its own locomotive. It is operated by steam generated in a boiler used in an engine. The boiler, engine, fuel, gasoline and water tanks are all compactly secured to the bottom of the vehicle and to the running gear. The complete result is the exceedingly handsome and useful types of road wagon called by the makers the "locomobile," half-tone views of which are shown here and on the first page of this journal.

The special characteristics of the locomobile are lightness of structure, and speed, economy and simplicity of operation. The water in the boiler is converted into steam by heat from burning gasoline vapor. The gasoline is carried in a copper tank and forced by compressed air through the boiler, where it is vaporized to the burner underneath where it is

Auriferous Beach Sands, Wreck Bay, British Columbia.

The only point at which black sand has been profitably worked in British Columbia so far is at Wreck bay, which is situated a few miles north of Amphitrite point on the west coast of Vancouver island, and in the West Coast Vancouver Island mining division. The discovery and exploitation of this deposit has undoubtedly been assisted by the fact that it occurs on the tongue of land separating Ucluelet arm from the open sea and is, comparatively speaking, easily accessible from the shoreward side.

Wreck bay extends 3 miles along the coast and about 1 mile inland. The beach is exposed at low tide and consists of a garnetiferous black sand mixed with ordinary sand and gravel. During the season of 1900, \$12,584 were expended, chiefly in the construction of a flume 9800 feet long, and in the building of a dam across Lost Shoe creek. The gold extracted during the same season when work was carried on in a limited way, and under difficulties of some magnitude, amounted to \$10,639. For 1901 operations have just begun and give promise of most satisfactory results. The occurrence of the gold is of the type which may be described as the result of glacial deposition in the bank confronting the beach and subsequent erosion and concentration by the action of wind and tide.

In addition to the Wreck bay deposit there exists east of the mouth of the Jordan river and about 46 miles west of Victoria, what appears to be an old river bed. The river was probably a glacial stream, and the material which it carried derived from the graphitic slates which extend in a somewhat narrow belt from the Jordan river in a southeasterly direction to Esquimalt harbor, outcropping at Goldstream and Langford lake. These slates are probably of Triassic age and analogous to the rocks found at Boston bar in the Fraser river and in the Cariboo, Columbia, Omineca, Purcell and Selkirk mountains. Stringers of quartz which frequently carry gold occur in the slates. The placer deposits of the Jordan river are therefore most likely an

bay, B. C., is a modified sluice fitted with amalgamated plates. This machine is 30 inches wide and has a large and a small compartment, with a means of deflecting more or less water into either. The larger compartment carries the gravel over the grizzly and does the washing, while the water in the small compartment acts as a carrier for the coarser tailings which fail to pass through the 6-mesh screen with which the apparatus is furnished. After passing through the grizzly and screen, the gravel travels over four amalgamated plates, each 30x16 inches, and then over a series of riffles and traps, the principal object of which is to prevent any loss of mercury.

In actual practice, on a cleanup of say \$300, \$250 has been found on the first plate, \$40 on the second plate, \$10 on the third, and nothing on the fourth. The gold, though fine, is particularly clean and free from that "rusty" character which has proved such an obstacle in other workings of a similar nature.

The tailings are delivered below high-water mark, and as the ground is worked out the machines can be easily moved along and the flume tapped at a fresh place. For labor, each machine requires about five and one-half men, as follows:

One man stripping off non-paying dirt; one man throwing up gravel to platform of machine; one man feeding machine; one man looking after machine and tailings; the part time of one man prospecting ground.

The capacity of each 30-inch machine is a little over twenty-five tons per day of nine hours. There are now six machines on the ground, but practically only one was in working order before the bad weather set in, necessitating a partial suspension of the work.

From the Ucluelet Co.'s claim 600 yards of gravel have been put through the machine, giving a yield of \$9400, or a little over \$15.50 per yard. This represents the yield of about one-tenth of a claim. An average section of the ground would appear to be as follows:

1. Two feet of non-pay, which has to be stripped.
2. Three feet of pay dirt, the lower 8 to 18 inches of which is fairly rich.
3. A fine barren sand, or sometimes clay, underlying the pay dirt.

During this season the machine was modified, in the following particulars: The swift stream first carries the material over 5 feet of riffles and then over angle iron so placed that the apex is upwards and arranged longitudinally within a sixteenth of an inch between each, in the direction of the current. The coarser gravel passes over the grating on the dump, while the finer material drops through the grating with such sufficient water to wash it over the plates, into a box perforated at the farther end and thence onto the amalgamated copper plates. In order to prevent loss of amalgam the current is led from the plates to cross-riffles, from the riffles to a box with baffles and thence to the dump.

The fineness of Wreck bay gold varies from \$18 to \$20 per ounce after melting. During 1900, 700 ounces were recovered. During the present season the value of the gold produced was, to July 1st, a little over \$5000. While this amount is insignificant, the returns later are expected to be much more considerable when the number of machines employed for saving the gold are increased.—B. C. Mining Record.

Converter or Bessemer Process of Copper Reduction.*

By C. C. LONGRIDGE.

This process is used for obtaining coarse copper from mattes produced by the German, English, or Anglo-German methods. The principle is to force air through the molten matte, thereby converting sulphides of copper and iron into cuprous and ferrous oxides, with the evolution of sulphur dioxide. The cuprous oxide decomposes any undecomposed sulphide of copper, producing metallic copper and sulphur dioxide, while the ferrous oxide is slagged off by the silica of the converter lining. If the blast is continued long enough, coarse copper and slag are obtained; if it is stopped earlier, a richer matte and slag result.

Raw ore or very low-grade mattes are not suitable for this process, partly because more slag would be formed than could be conveniently handled, or kept fluid by the heat developed by the oxidation of the sulphides; partly because the excess of iron in such mattes would too strongly attack the converter lining; and partly because no practical system of continuously feeding in the matte has been found. The mattes, therefore, to be suitable, should contain at least 25%, and preferably 45% to 50% of copper. Mattes containing more than 60% of copper do not furnish enough heat by oxidation to complete the process. The heat units freed by oxidation are: for sulphur, about 2200; and for iron, about 1576. To these should be added the heat from the combination of iron and silica, while a considerable reduction must be made for the dissociation of the sulphides.

In bessemerizing poor matte, the charge is blown up to 60% or 70% of copper. The slag is then removed, fresh matte added, and the whole blown to

*Trans. Inst. of Mining Engineers, Newcastle-upon-Tyne, December Meeting.

Locomobile Surrey at Sacramento, Cal.

ignited. The operation is very simple. The operator sits on the right hand side of the carriage, with his left hand on the steering gear. With the right hand the throttle lever is pushed forward slowly. This admits steam to the cylinder and the carriage starts. Speed is increased by pushing the lever forward. The carriage is reversed by bringing the throttle lever to its original position and the reversing lever then thrown back; the steam admitted to the cylinders by the throttle lever reverses the motion of the carriage. To stop the carriage, shut off steam and apply brake. On average roads a tank of gasoline will operate 40 miles, and 20 to 25 miles are made with one tank of water. As high as 40 miles an hour rate of speed can be had.

The illustrations are of locomobiles in use for pleasure riding. Their appearance in parks, streets and country roads is ceasing to be a novelty, with the rapidly increasing number coming into use. Experience with them is proving that they cost to keep less than a horse, are safer and more comfortable.

The carriages are manufactured by the Locomobile Co. of America, with office at 11 Broadway, New York. The Locomobile Co. of the Pacific, the Pacific coast representatives of the manufacturers, has its office and warerooms at No. 1622 Market street, San Francisco, Cal.

accumulation from large denuded areas of these rocks.

The formation from the Jordan river eastward towards Sooke consists of clay, sandstone and conglomerate of Tertiary age. For a considerable distance from the mouth of the Jordan, the shore is 25 feet to 100 feet high and composed of blue clay. The beach between the clay and the water line is composed of black sand; while along the top of the clay cliffs there is gravel heavily stained with oxide of iron for a thickness of 3 to 10 feet. The gold in this gravel is not visible to the naked eye, but by panning the black sand becomes concentrated and from it the gold can be easily removed. Near the mouth of the Jordan, the sand is 2 to 3 feet in thickness and pans from top to bottom, though best values are found at the bottom near the blue clay bed. A probable average would be 50 cents per ton of sand. The deposits could be easily worked, so operations might be carried on at very little expense. There are also doubtless many unknown, or at least unprospected, deposits of black sand on the west coast of Vancouver island, and on the northern part of the west coast of British Columbia deposited by glaciers which have long since disappeared or have shrunk to the tops of the mountains.

The apparatus used for saving the gold at Wreck

99% of copper. The work of the converter is known to be complete when the evolution of sulphur dioxide ceases, and little particles of copper appear in the flame. In the process, arsenic and antimony are completely volatilized; zinc is partly so, and partly slagged off; lead, tin and cobalt pass into the slag; and nickel and bismuth remain in the copper. Converter slag is sufficiently rich to need retreatment, and on account of its iron is a useful flux for melting siliceous ores.

The loss in bessemerizing, with provision for ample dust chamber capacity, and too many volatile metals in the matte, is from 1% to 1.5% of the copper. The loss in silver lies between 2% and 2.5%. This latter loss increases greatly with the presence of volatile metals. Thus in bessemerizing concentrated matte from lead-silver furnaces, carrying 40% of copper and 15% of lead, the loss in silver has reached about 50%. The loss also stands in close relation to the blast pressure.

The heaviest expenses in bessemerizing are power for the blast, and refractory materials for the converter linings. Hence with ample water power, and the necessary quartz and clay, it may, where fuel is costly, be cheaper to produce a low-grade matte and throw more work on the converter. On the other hand, with cheaper fuel, and no water power, it is generally better, especially with fine ores and concentrates, to do most of the desulphurization in the calciners and furnace.

Mining and Metallurgical Patents.

Patents Issued August 6, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

DREDGING APPARATUS.—No. 679,738; J. G. Garwood, Butte, Mont.

A support, a relatively fixed conductor section mounted to swing in vertical and horizontal planes upon support, a sliding section adapted to telescope, conductor sections serving as conveyors for discharge of load by gravity therethrough when dredge is raised, a shovel carried by sliding section, guide and brace bars slidably connected to fixed conductor section and also connected to sliding conductor section to guide and brace and limit outward movement of latter, means for raising and lowering dredge, a cylinder mounted upon fixed section, a piston in cylinder, a crosshead sliding in guides on fixed conductor section and connected to piston rod, and connecting rods between crossheads and sliding conductor section.

APPARATUS FOR DESULPHURIZING ORES.—No. 680,171; E. M. Oviatt and A. Dean, Denver, Colo.

A furnace, having a settling chamber, means for heating interior of furnace, a retort cylinder mounted within furnace, and discharging in front of means for heating interior of furnace, a conveyor arranged to operate within retort cylinder, a manifold located

directly over retort cylinder, having communication with retort cylinder, and means whereby gases liberated in retort cylinder are drawn into and delivered from manifold, means for heating interior of furnace being adapted to complete roasting of ore and drive it into settling chamber.

ART OR PROCESS OF REFINING LEAD BY ELECTROLYSIS.—No. 679,824; A. G. Betts, Lansingburg, N. Y.

Subjecting lead alloy as anode to electric current in a solution of a lead salt of a fluorine acid, and electrodepositing lead on cathode.

DISCHARGE DOOR FOR CYANIDE TANKS.—No. 680,154; D. Jansen, Johannesburg, South African Republic.

A door provided on its upper side with a series of channels and cross-channels B, over which is placed a piece of filtering medium D', a wooden rim A', to which filtering medium is fastened, seating C into which door A fits, C being provided with a wooden rim C', to which filtering medium at bottom of tank is secured and cross-channels C' to drain solution into bottom of tank, hinge E, fastening devices F F, air tube G' interposed between door A and seating C contained within recess G and means for inflating same.

ORE CONCENTRATOR.—No. 679,869; A. H. Stebbins, Little Rock, Ark.

A separating chamber of gradually increasing cross-sectional area from its bottom to its top, a feeding device for feeding material into upper part of separating chamber, an air or fluid inlet below feeding device, means for producing a blast of air or fluid through same, an augmenting and distributing device adjacent to inlet for producing a maximum strength of current and distributing same around separating chamber, and suitable outlets for concentrates and waste products, lower portion of augmenting and distributing device against which blast is directed conforming in shape to adjacent walls of separating

chamber to contract the blast between the two and thereby give maximum strength to air currents throughout space between device and separating chamber.

PROCESS OF MANUFACTURING COPPER SULPHATES.—No. 679,985; H. Palas and F. Cotta, Marseilles, France.

Separating the anode and cathode by a porous diaphragm, supplying a stream of electrolyte solution of an alkali-metal sulphate to a soluble anode of metal to be transformed into sulphate, supplying another stream of same electrolyte solution to cathode other side of diaphragm and passing a current electricity therethrough.

PROCESS OF TREATING METAL-BEARING ROCK.—No. 679,901; T. J. Lovett, Chicago, Ill.

Subjecting a mass of broken ore or rock to simultaneous triturating and torsional impacts, whereby each particle of rock grinds up its neighbor, producing trituration of non-metallic element and forming copper into lumps of slug, pellet or similar shape.

MINERS' LAMP SUPPORT.—No. 680,133; S. Davis, New York, N. Y.

A base piece and arm made to swivel or pivot on base and extended downward from pivot to support a lamp with its center of gravity below pivot.

WELDING.—No. 680,182; B. B. Thomas, Rossville, Tenn.

The method consisting in cleansing the metal, raising same to a red heat, subjecting heated portions to a welding powder, which has properties of promoting fusion, causing softening during heating of metals, and also hardening during cooling, and consisting of carbonate of iron, steel dust or cast-iron filings, pulverized glass, pulverized borax, prussiate of potash, muriate of ammonia and pulverized rosin, then reheating treated metals to a white heat, and finally submitting metals to a continuous pressure.

ELECTROLYTIC PROCESS OF OBTAINING METALS FROM THEIR FUSED COMPOUNDS.—No. 679,997; G. P. Scholl, Philadelphia, Pa.

Fusing a bath containing a mixture of sulphide of the desired metal with another compound of metal which is convertible into sulphide by nascent sulphur; and subjecting fused bath to electrolysis by action of suitable electrodes.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

The test made at the Alaska-Juneau mine in Silver Bow basin, near Juneau, to determine the milling value of the ore, is believed to have proven satisfactory, as a 6000-foot tunnel is projected from Snow Slide gulch to tap the lower workings of the property. This tunnel will have a double track. R. Mein, secretary of the company, says that the survey has been made. With the tunnel built, a large stamp mill will be put on the property.

KETCHIKAN.

Moran, Charles & Smallwood are putting up a 2-stamp prospecting mill at Smuggler's Cove, Ketchikan P. O., and developing a free-gold lead. They expect to be able to make the output pay expenses, and will add more stamps as ore is developed.—The Keystone mine is being opened by Supt. J. A. Bradley.

McMillin & Schultz are doing development work on a Chomondelay Sound, Prince of Wales Island, mine, under the direction of A. E. Knapp, M. E. The developments thus far are about 150 feet of drifting on a small ledge, showing ore averaging about \$25 per ton.

NOME.

S. Miller of the Tishou district says that a contact of trachite and soft schist crosses Hume creek at No. 6. This contact is heavily charged with arsenical iron, and in places shows large bunches of pulverized, amber-colored quartz, which carry fine gold in small quantities. Mr. Miller says this formation can be easily traced for a distance of 8 miles, extending from Nolan creek, on the Tishou, to No. 9 on the Bluestone river, which empties into Grantley harbor, cropping out very distinctly on both sides of the Tishou river canyon. It is probably the lode source of the placer gold which is found in streams below the belt but not above it.

ARIZONA.

GILA COUNTY.

W. H. Dawson, president, and E. L. De Lestry, secretary of the Fraternity Mines Co. of St. Paul, Minn., have bought the Rattlesnake and Rattlesnake Extension claims, near Pinto creek, Globe P. O., and have arranged to do considerable development work on these properties at once.

The Bobtail Mines Co.'s property on Mineral creek, 18 miles from Globe, is being developed by F. D. Adams, Supt. There is said to be 5 feet of ore in the drifts at the 100-foot level, which assays \$45.45 per ton in gold, silver and copper. A whim has been put up at shaft No. 1, 718 feet of track laid to the dump above the mill site, and 200 tons of ore moved to the new dump. With a hoist and pump on shaft No. 1, it is said a 50-ton concentrating plant, or even one of greater capacity, could be supplied with ore.

A discovery of ore on one of the claims, near Globe, owned by W. House, C. Sherwood and J. Mathews, has been made. It is a ledge some 50 feet wide, which prospects well in copper. On another part of the property there is a conglomerate which tests have shown to carry a considerable per cent of copper. It is ore that it is believed can be successfully treated by leaching.

MARICOPA COUNTY.

J. Wetherlay, manager of the Socorro G. M. Co., reports work at the mine, preparing the camp. He is now putting in a well about 2 miles below Harrisburg. The pump and pipe line are to be installed immediately to provide water while the machinery is being installed at the mine.

The Oro Grande M. Co. at Wickenburg is working eighteen miners and the main shaft is down 280 feet. The last 20 feet in the shaft has gone through a rich ore body.

PIMA COUNTY.

C. Bauer, at a depth of 10 feet, has uncovered a 2½-foot ledge of rich gold rock in the Ella claim, in Canada del Oro.

PINAL COUNTY.

The Monte Cristo M. Co. is operating 24 miles south of Casa Grande. There is a 10-stamp mill on the property, but D. McFarland, the manager, states that the company will enlarge the mill and add a cyanide plant to it.

SANTA CRUZ COUNTY.

The Last Chance mine and mill in the Mogollons, at Patagonia, has closed down.

YAVAPAI COUNTY.

The Dividend M. Co. at Chaparral are doing extensive development on a large body of free milling ore. F. E. Biles is Supt. and is working fifteen men.

At the Cash mine, at Maxton, the shaft

is down about 330 feet on the main ledge and the ore taken out is a copper sulphide carrying gold and silver. The company is building a 10-stamp mill.

YUMA COUNTY.

While sinking on the San Francisco mine, Cedar Valley, a body of ore was encountered containing specimen rock. The mine has a large body of ore opened up. The mill now at the mine is not adapted to the ore and a new plant will probably be installed. C. D. Pickering is manager.

CALIFORNIA.

AMADOR COUNTY.

In drifting at the 1800-foot level of the Central-Eureka, at Jackson, a rich ore deposit was encountered. This pocket is reported to be richer than any heretofore found. Over half a ton of extraordinary rich rock was taken out in two or three days.

L. A. Gross of Drytown is making arrangements to go East to organize the Centennial M. Co. and resume operations on the mine, which have been suspended some time.

BUTTE COUNTY.

The Haesloop or Cornelius mine, in Morris ravine, sometimes known as the Yuba placer mine, near Oroville, has been sold through W. P. Lynch of Cherokee. The mine is a steady producer. It is a drift gravel mine, near the Hendricks hydraulic mine. The new owners will put in some machinery and work it more extensively.

R. G. Ford of Minneapolis, Minn., president of the Miller M. Co., owning a mine on the ridge above Forbestown, says that his company is working fifteen men on a drain tunnel, which, when completed, he calculated would drain the workings for perhaps ten years in advance. After the tunnel is finished, the company would then likely erect a 20-stamp mill. R. S. Haskell is Supt., also an Eastern man.

CALAVERAS COUNTY.

The Tulloch mine hoist, mill and powder house, situated near Angels Camp, have been destroyed by fire. About 5000 pounds of powder was exploded, but no one was injured. The loss is estimated at \$8000.

An air compressor has been contracted for by the Oriole Co., at Angels, to operate air drills.

At the Lone Star mine, at West Point, nine men are employed. The shaft is at present 300 feet deep, and stoping will be commenced in levels 1 and 2. J. E. King is Supt.

M. D. L. Wickham is at present engaged in putting five tons of ore through his arrastra on Bear creek at West Point. This ore was taken from his mine, the Little Ohio, and will, it is estimated, yield on an average \$40 to the ton.

The Emery G. M. Co., at El Dorado, has had a survey made on the South Fork of the Mokelumne river for a flume, which will be 7 miles long. A sawmill will be built by the company on the C. W. Werle place to cut lumber for the flume, about 1,000,000 feet being required.

MONO COUNTY.

A cloudburst in the mountains above the Sweetwater Con. mine, near Bridgeport, did considerable damage to the milling plant which was under construction, carrying away lumber and some of the machinery. The greatest loss to the company is the delay in the erection of its mill, which it was intended to have run before winter, but which is now not possible before next spring.

NEVADA COUNTY.

The Gray Eagle M. Co. has been incorporated to mine at Maybirt. The directors are C. Richards, J. B. Ott, W. Tierman, F. Percival and H. Dienier. Of the capital stock of \$50,000 the company says that \$30,000 has already been subscribed.

The Orleans mine has resumed operations after a shutdown of several months. The mine has been lying idle awaiting a large electric motor which had been ordered from the East. It is now in operation and working to perfection.

W. H. Bray of San Francisco has taken a bond on the Posey mine, at Nevada City, and intends to do considerable development work on the property. The ledge is small, but rich.

The Golden West mine, near Grass Valley, owned by C. Temby, J. Seymour and C. D. Trenggning, is to be developed. There is a 5-foot ledge of free-milling ore in the property.

PLACER COUNTY.

The new Huntington mill at the Annie Laurie quartz mine, near Colfax, has been started up.

The Pioneer quartz mine, near Towle, will resume work before long. An assessment of 50 cents per share has been made, which is expected to provide \$50,000 to do development work with.

PLUMAS COUNTY.

P. Mulloy has bonded the Needed

Wealth quartz property, situated on Buck's creek, near Quincy, and also a portion of an adjoining location known as the Shamrock to F. D. Frazier for eighteen months; price \$20,000.

SHASTA COUNTY.

The old Texas & Georgia gold mine, at Whitehouse, Old Diggings district, is reported to be sold. The mine has lately been worked under a lease by H. C. Woodrow and C. C. Bush of Redding. The buyer is the Texas G. M. & Power Co. W. H. Garlick is president; E. W. Runyon of Red Bluff, H. Eikoff and A. B. Paul of San Francisco and H. C. Woodrow of Redding are the Board of Directors.

E. Harvey of San Francisco has bonded the Keystone No. 1, Keystone No. 2, Wishbone, Homestead, Lucky Ned and Mountain Bell quartz claims at Whitehouse, Old Diggings district. The option runs to June 10, 1904, and the owners agree to allow the bondholder 50% of the net value determined by smelter returns, the other half to be applied on account of the purchase price.

The Niagara mine, near French Gulch, now owned by Holland people represented by J. DeFremercy of New York, has been bonded to W. T. St. Auburn, a former manager of the mine. At present the mine is being worked in a small way by tributaries. For further development it will be necessary to sink below the old workings at an estimated cost of from \$20,000 to \$25,000, as both hoisting and pumping plants would have to be installed. A new lower tunnel to crosscut the vein 400 feet below the present works would have to be nearly a mile in length. There is a complete 18-stamp mill on the property.

The records at Redding show the recording of an average of 250 quartz and placer locations per month for the past year. The locations are about equally divided between quartz and placer.

SIERRA COUNTY.

J. R. Cox, A. Hunter and J. C. Taylor have bought the Barney Gallagher mine, on the North Fork, near Downville. The new owners will operate the property as a drift mine.

A. R. Pride and R. Babb, who are operating on Deer creek, near Downville, have applied to the California Debris Commission for a permit to mine by the hydraulic process.

SISKIYOU COUNTY.

It is reported that the claims on the Salmon River Con. M. Co. have been bonded for a sum understood to be nearly \$1,000,000. F. M. Archer of Redding has the option. The property is at the head of the South Fork of the Salmon river and covers 210 acres, including Deep Bank and Thompson Bar claims. The paystreak is said to be deep, between 200 and 300 feet. There are now three giants, with 4980 feet of flume and 940 feet of ditch, in operation. The claims are being worked with W. A. Cooper as Supt.

The Boston, Mass., stockholders of the Black Bear quartz mine, at Black Bear, have directed Supt. J. Daggett to start the mill. A large body of fine ore has been struck recently, which will keep the mill in operation. Mr. Espey of Seattle, Wash., is said to have met with excellent success in his claim at the mouth of Hungry creek, near Coles, which pays well at present.

The Sterling, Blue Jay and other quartz mines in the Hungry Creek district are lying idle on account of litigation; the Central, owned by C. R. Wiegand of Seattle, Wash., is not worked at present.

J. O. Rusby is now working a quartz ledge on Deadwood, near Yreka, which he has bonded from T. Macaulay. He is finding good prospects, and intends putting up a mill in a short time.

TRINITY COUNTY.

Eighty-six men are at work on the Sweepstake, at Weaverville, thirty-seven of them opening up the mine for the winter's run. J. H. Kelly is superintendent of this work under F. Hall, manager. A second lot of men are at work under R. Howard constructing a reservoir at the mine to feed the hydraulics. Another force of men are employed in erecting the sawmill on Dutton's creek.

The Valencia Co. copper property at New River, Sherwood P. O., known as the Bingo, is a new proposition. The ledge is claimed to be 20 feet wide.

YUBA COUNTY.

The Oroville Gold Dredging & Exploration Co., in which J. E. Doolittle and W. F. Bradley of San Francisco are interested, has bought 2000 acres of placer claims, which it is asserted will require seventy-five years of continuous exploitation by dredging to exhaust. The price to be paid for the property is said to be between \$200,000 and \$300,000.

Condemnation suits to obtain title and possession of land wanted for hydraulic debris barriers on the Yuba river are to

be brought. The land required is 16,000 acres, and title has already been bought for part of it. Some owners are holding out for condemnation proceedings in the United States Circuit Court in the expectation of being paid more. The suits are to be brought under instructions of the War Department, whose engineers have charge of construction of the dams.

COLORADO.

BOULDER COUNTY.

A strike of tungsten has been made near Freshwater. The ore, it is claimed, will average 50% tungsten across the 2-foot vein. The owners are J. M. White and associates of Freshwater. The last sale of wolfram ore, in which a quotation was made, was at Boulder a short time ago, and the price paid is said to have been \$150 a ton for ore carrying 50% tungstic acid.

Race, Bruner & Korf of Eldora have sold the Beatrice group of five claims on Guinn mountain to Cripple Creek parties for \$5000. Shortly after the deed was closed, Eastern parties, who had been examining the property, are said to have offered \$20,000—\$5000 down.

The Tamborine G. M. Co. of Colorado Springs, of which G. P. Tiffany is president, has installed a new 50 H. P. hoist and boiler and is erecting a new shaft-house. The company has just paid a \$7000 dividend.

CLEAR CREEK COUNTY.

(Special Correspondence).—Work on the Oro Verde, at Yankee, has made some progress this season. Crosscuts to the extent of 500 feet have opened two veins, on which considerable drifting has been done. An upraise is now being made in ore. Recent sample tests show the ore to run about \$16 per ton. J. L. Goodier is manager.

Yankee, Aug. 10.

(Special Correspondence).—The Gold Fissure G. M. Co., G. A. Bristol, manager, have sunk their shaft to a depth of 275 feet, on their group near Empire. At the 175 level a crosscut runs 100 feet to the ore body, there being 150 feet of drifting on the latter. The ore is an iron and copper sulphide. According to shipments made the smelting ore runs from \$35 to \$100 per ton and the mill ore about \$12 per ton. A run of 150 tons was made at a concentrating mill in the neighborhood.

The Empire Tunnel & G. M. Co. has been organized to drive a tunnel into Coyote mountain, near Empire, interested in which are Messrs. Dewey, Maxwell, Johnson and others. The work has proceeded over 500 feet; and it is expected in time to run 2 miles and cut 1500 to 2000 feet below the apex in the mountain. A 2400-foot flume is to be built to convey water for power purposes.

Empire, Aug. 12.

The Fall River M. & M. Co. has been incorporated by C. M. Berry, R. S. Barker, T. W. Hoyt, G. D. Preston and J. I. Pritchard; capital, \$250,000. The proposition is to operate on Fall river near Georgetown, where the company owns properties.

The Seaton Mountain G. M. Co. has been incorporated by F. Carruthers, F. A. Joslin and W. M. Desch; capital, \$100,000.

O'Neill, Barth & Co., of Empire, have bought the Heddensburg lode, and are having machinery placed for operation by electric power. The mine shows a streak of ore in the bottom of the shaft which averages about \$175 per ton.

The steam shovel to be used by the Newhouse people in the tunnel at Idaho Springs has been tested and it is reported that in the experiments made it was successfully demonstrated that the shovel could be operated on the rock with or without hoist plates.

The Red Oak concentrator at Georgetown has been started up again. In the mine it is reported that there is ore 5 feet wide developed for 600 feet in length that is said to average \$20 per ton in value as mined.

The Gold Bug mine on Covode mountain, at Empire, is showing ore in the upper and lower adits, in the middle working. A new adit, recently started, is in 200 feet and is exhibiting a marked increase in the value of the ore. The average percentage of copper in the Covode mountain ores is found in the Gold Bug, and will add to the value. W. P. Clough of New York has bought a considerable interest in the mine and will superintend it.

FREMONT COUNTY.

(Special Correspondence).—A concentrating plant of considerable capacity is being erected at Cyanide, near Florence, to work over the mill tailings of the Metallic Extraction Co. C. A. Hoyt, for several years assayer at the latter plant, is to become manager of the concentrating plant.

Florence, Aug. 10.

The New Jersey Zinc Co. is building a big concentrating mill at Canon City, to treat the zinc product of Lake county.

The Zinc Company, which owns the Colonel Sellers mine, is now taking crude zinc ore for its works at Mineral Point, Wis. The Moyer and A. Y. and Minnie are shipping what zinc ore they can save that will run from 48% to 50%. Although zinc is now selling in New York at almost the lowest price in its history, \$3.90 per 100, a 4% zinc ore will pay a small profit to the miner. The principal item of expense is the freight from Leadville to Wisconsin.

GILPIN COUNTY.

The new Sleepy Hollow G. M. Co. has incorporated, capital \$300,000, with J. F. Hoskins, F. L. Sigel and S. A. Howes as directors. It intends to operate the Sleepy Hollow mine, near Black Hawk, which has been worked only on a small scale. The shaft has been sunk nearly 900 feet and the property has been outputting a smelting product above the average grade. J. F. Hoskins is manager.

M. Wilkinson and associates are drifting in their lease on the dump lode on Bobtail hill, at Black Hawk, and are taking out milling and smelting ores, both of a low grade.

Sinking has been resumed in the O'Neill mine, in Gregory district, near Black Hawk, under contract. The shaft is now about 575 feet deep, and the company intends to put it down to a depth of 1000 feet. H. C. Eastman is manager.

Work has been resumed on the Alps property at Quartz hill, Central City, by the lessees, and the extending of the west 1320-foot level is being done with the expectation of cutting the ore shoot almost any day. J. Williams is Supt. of the property.

Manager B. Campbell of the Cashier G. M. & Red. Co., operating the Brooklyn group, at Central City, is sinking the shaft to the 630-foot level. New York State people are interested in this property.

HINSDALE COUNTY.

(Special Correspondence).—R. L. Ray of Lake City, manager of the Tobacco mine, located near the top of the range between Animas river and Lake Fork of the Gunnison, states that a compressor plant will be put in at the mine and that a dam is being built to develop 350 H. P. for electric force at the mine, 12 miles from Sherman. The intention is to erect a mill $\frac{1}{2}$ mile from the mine within a few months. The mine is developed by a 1700-foot tunnel that starts in one gulch and comes out into another. The ores will average \$15 per ton, Mr. Ray thinks, and partake some of the characteristics of tellurium. This mine is one of the highest in the State, being nearly 14,000 feet altitude. The stockholders are Indianapolis men, mainly.

Lake City, Aug. 5.

A strike has been made in the Minnie Gulch mine at Eureka. In the stope from No. 2 tunnel 2 feet of ore has been opened up in a 7-foot vein. Assays give from 3.5 to 4.5 ounces of gold to the ton, besides silver values.

The Golden Fleece mine at Hotchkiss has been producing a large amount of rich ore from a shoot developed in the tunnel. The first car shipped netted over \$1400, and the second car \$1575 for less than ten tons. An upraise will be made to a connection with the upper workings.

SUMMIT COUNTY.

Dredger work on the Swan river, near Breckenridge, in charge of B. S. Revett, has resulted in reaching the bedrock at 40 feet in one place and the finding of unusually rich bedrock wash.

GUNNISON COUNTY.

The Doctor mine on Spring creek, about 20 miles north of Gunnison, has been started up under a lease and bond by M. Ferrell of Aspen. He is shipping good ore.

The Southwestern Smelting Co., representing Denver and Chicago capital, is putting up a 100-ton smelter at White Pine to handle the low-grade lead ores of the district. E. C. Eddie of Denver is in charge of construction.

LAKE COUNTY.

(Special Correspondence).—The Evelyn is located at about the highest point on Carbonate hill, above Leadville. A shaft was sunk thereon to 900 feet depth, which went through 800 feet of porphyry, then into a lime stratum, a sheet of chert being found in the lime carrying an iron sulphide ore that sampled about thirty ounces silver to the ton. The find was something of a surprise to many mining men, as the locality had been regarded as a barren zone. Ex-Governor Thomas, C. C. Parsons, Maurice Starke and others are in control of the Evelyn.

Leadville, Aug. 10.

(Special Correspondence).—Manager Schwarz of the Iron-Silver mine reports the production of about 5500 tons of ore per month, the bulk of which is shipped direct to the smelters, a small percentage being run through the mill for the pur-

pose of making a separation of the zinc sulphides from the iron-lead material. A considerable part of this separation is effected by sorting in the mine. In the Stevens shaft, on this group, a drift is being run for the contact. A pump is being installed in the Stevens shaft and a 125 H. P. boiler is being put in at the Moyer. Leadville, Aug. 12.

An important piece of work has been started by H. I. Higgins of the Leadville Tunneling & Drainage Co., which owns the Homer placer at Leadville. It is sinking a shaft 2000 feet west of the Rio Grande tracks and north of the boulevard. A 60 H. P. boiler has been set up, and a hoist put on the ground. This is a portion of the Leadville basin that has never been explored.

The Montezuma M. & P. Co., an English corporation, is operating near Coaldale. A tunnel is now in about 400 feet. The ground is being prepared for a settlement to be called Pleasanton. E. L. Barnes is manager, Mr. Wile of Australia metallurgist and D. E. Wilson of Canyon City has charge of building operations.

The Copper City M. & M. Co. has been incorporated; capital \$1,000,000; L. E. McDougal of Canyon City president and F. B. Archer of Bellaire, Ohio, secretary. The company owns seven claims in Copper gulch, near Canyon City. In the tests of ores made the values have run from \$5 to \$133 in copper per ton.

The production of the Fanny Rawlings, at Leadville, is maintained by the South Winnie Leasing Co. at about four to five tons per day, the ore being hauled by wagon to smelter at Leadville.

The New Monarch Co. has opened up the Fannie Rawlings ore body. The shaft has been sunk to a depth of 700 feet, the sulphide having been followed down for over 100 feet. Water is now coming in and pumps will have to be installed shortly. The values are improving with depth, and it is estimated that there are at least 100 feet more depth of the ore body.

MINERAL COUNTY.

The American Sulphur & M. Co. is developing its sulphur deposits. Its claims make an area 6 miles in length and 4 miles in width, making a total of 15,360 acres. The vein on the Pickett claim, the first developed property of the company, has been opened by a pit and ore exposed running over 75% sulphur. The diamond drill bore on the lower drift of the same claim is said to have disclosed another layer of sulphur below the body near the surface.

PARK COUNTY.

J. Moynahan, who has been doing development work on his J. G. Blaine mine at Alma, reports a discovery of a 9-inch streak of sulphide ore at the surface.

PITKIN COUNTY.

A strike on the Empire mine at Ashcroft, owned by Capt. Green, is reported. The ore vein encountered is several feet between walls and carries good values in silver and lead. J. Canning and B. Brown of Aspen have taken a lease on the mine and are prepared to extensively develop it.

The Little Tom M. Co. has been incorporated at Aspen; T. Beck is president and G. E. Guthrie secretary. The company is working on the Unexpected and Little Tom claims, near Tenderfoot. The company is engaged in cleaning out and retimbering the tunnel, besides developing other portions of the property by sinking an incline.

PUEBLO COUNTY.

J. B. Grant, J. F. Campion and J. W. Springer have incorporated the Ideal Portland Cement Co., capital \$500,000, to operate quarries, mines, clay lands, coal mines and cement mines, and to manufacture Portland cement. The operations of the company, it is stated, will be carried on principally in the counties of Arapahoe, Fremont and Pueblo. The principal offices will be located in Denver.

SAN JUAN COUNTY.

The Champion group No. 1 at Silverton has been bought by E. S. Bacon of Boston, Mass., as trustee for Boston people from E. H. DeVore. The Champion mine consists of three claims, developed by a 125-foot tunnel, opening up an ore shoot for 100 feet. E. H. DeVore is Supt.

Work is steadily progressing on the Idaho properties, Kendall mountain, Silverton, with good results, under the management of O. Hanson. The No. 3 tunnel is now in 1000 feet. No. 2 tunnel, 400 feet above, is in 800 feet, and No. 1 tunnel, 150 feet farther up the mountain, is in 700 feet. The tunnels are in milling ore. Upraises will be made connecting the tunnels. A compressor plant will be added to the equipment.

The Specie Payment G. M. Co. has been incorporated by Colley & Co. and associates of Boston, Mass., to operate the Specie Payment mine, near Georgetown, which the company has bought from E. J. Williams for, it is reported, \$625,000.

The development work consists of two tunnels aggregating 1500 feet, and a 475-foot shaft on a vein from 3 to 20 feet wide, the smelting ore of which runs \$85 a ton, and the remainder \$5 to \$7.

SAN MIGUEL COUNTY.

The sale of the San Bernardo mines on Sunshine mountain, near Telluride, has been closed and the first payment has been made. The buyers are W. A. Otis and Shove, Aldrich & Co. of Colorado Springs. The group comprises five patented and five unpatented lode claims extensively developed, two patented mill sites, a sixty-ton mill, tramway and water power. A. B. Litchfield is consulting engineer and manager for the buyers.

The Four Metals Co., operating a group of lode claims on Turkey creek, Telluride, have made a strike on the Palmyra vein which was found to be 9 feet in width between walls, 3 feet of shipping ore and the remainder good milling grade. The building of a mill at the earliest possible date is under consideration. J. H. Shockley is Supt.

TELLER COUNTY.

D. Heaton has taken an option on a block of the Wilson claim of the Free Coinage Co., located on Bull hill, near Altman. It is Mr. Heaton's intention to remove the electric hoist now in use and install a steam hoist and a compressor. The shaft is now down to the 300-foot level and is to be sunk to the 500-foot level.

The Spratt lease on the Kimberly property of the El Paso Con. at Cripple Creek has been bought by G. W. Armprister for \$7500.

A new shaft is to be sunk on the Little Queen claim of the Ben Hur Co. at Cripple Creek to a depth of 800 feet at a cost of \$40,000, the work to be started as soon as the meeting of the stockholders is held and the capital stock of the company increased.

The semi-annual report to June 30th of F. J. Campbell, secretary and manager of the Anaconda M. Co., at Cripple Creek, has been made. During the period the company shipped ore of the value of \$17,111.24 gross and \$11,656.10 net; the lessees, during the same time, produced \$229,766.72 gross, from which the company received \$44,685.75 in royalties. Of the leases, the Peterson & Beam lease is first in production, having shipped a gross value of \$77,188. The Cyanide G. M. Co. comes next with a production of \$74,121.97 and D. Ogilvie & Co. third with \$47,997.04. The total output from all sources from the Anaconda properties was \$246,877.96 and the total amount of royalties \$56,341.94. The expenditures were \$40,912.14. The report of the treasurer shows a balance in the treasury of \$32,884.50 and 394,992 shares of stock.

IDAHO.

BEAR LAKE COUNTY.

J. A. Bagley, F. W. Rose, C. E. Harris, P. J. McDermott and A. D. Young are the incorporators and directors of the Montpelier C. M. & S. Co. of Montpelier. The company is capitalized at \$200,000.

BLAINE COUNTY.

H. W. Schultz of Ketchum is operating a group of nine claims on Boulder creek and is shipping ore which costs \$9 a ton to get it to the railroad at Ketchum and \$22 a ton additional for freight and treatment.

CUSTER COUNTY.

H. A. McCornick, manager of the Lucky Boy Co.'s mines and mills at Custer City, says the company is completing the new shaft, which will afford a more economical outlet to the mine. The mills will then be started up again.

IDAHO COUNTY.

A rich strike is reported made in the McKinley mine at Lucille. The upper tunnel has developed an 18-foot wide ledge carrying gold, silver and copper, an average mill sample showing \$13.85 value. Stafford & Myer have a contract to run a lower tunnel.

J. L. Dunn of Pierce City says he has bought a one-fourth interest in the Wild Rose mine and has put two prospecting mills on the property. The Wild Rose is the mine discovered by J. Gaffney this spring, from which considerable gold has already been taken by an experimental run in a small custom mill, and with mortar and pestle.

A strike has been made in the Grambrinus district, some 6 miles from Idaho City, of ore running \$80 to \$90 per ton in the Mountain Ram mine, owned by J. McCarty.

OWYHEE COUNTY.

It is reported that a body of good grade ore has been opened in the old De Lamar mine. The discovery was made in the west workings on the fourth level. The ore now showing is about 4 feet in width. The find is being opened with a view of determining its extent.

A long tunnel is being driven to open the mines on War Eagle mountain, at Sil-

ver City. This tunnel, double-tracked, will be 6000 feet long when completed, and is now in 4200 feet. It is being driven in under the old workings of the Golden Chest properties. The power for this work is transmitted 39 miles from the electric power plant on the Snake river. R. J. Anderson is manager.

On the Trade Dollar mine, at Silver City, a 13,000-foot tunnel is being driven and is now in 4600 feet. It is double-tracked and the cars are operated by mules. J. Hutchinson is manager.

MICHIGAN.

HOUGHTON COUNTY.

President Stanton of the Baltic M. Co. states that the lower levels of the Baltic mine at Houghton are showing up very much richer than in the upper levels. Two heads of the Atlantic mill, treating Baltic rock, showed an average of forty-six pounds of mineral to the ton of rock stamped, exclusive of mass and barrel work at the mine. The rock was not specially selected.

MONTANA.

BEAVERHEAD COUNTY.

(Special Correspondence).—Argenta district, 12 miles west of Dillon, was the center of much activity ten to fifteen years ago, and at present about forty men are employed there, who work the mines as leasers. The ores, so far as work discloses them, are a silver-lead carbonate. A number of shafts sink 200 to 300 feet to water level, below which the ores are believed to be generally of a baser character. In former years three small smelters operated in the district. The oxidized ore runs high in iron, as high as 70% lead carbonate, and 20% silica, with small percentages of galena and zinc. The lessees, of course, look for and mine the higher grade shoots. Shipments of such ore in small lots have amounted to 50 to 100 carloads per year for the last three or four years. The ore is found along a lime belt, the latter lying between syenite and granite. A move is being made at Dillon to establish a sampler to buy ore in such small lots as leasers may offer. It is believed here that the work in Argenta district will be greatly revived.

At Bannock, 30 miles from Dillon, three dredgers, each having a capacity of 3000 yards per day, are operating, one of them by electricity.

In Elkhorn district, 45 miles northwest of Dillon, some work is in progress, producing a siliceous copper and silver ore. Ten miles east of Elkhorn is the Polaris mine, in the lime belt, which yields a free milling silver ore.

On Birch creek, 14 miles northwest of Dillon, are a number of claims being developed by Butte men. The ores here are iron and copper pyrites, with some bornite.

On Stone creek, east of Dillon, two Chicago companies are opening some properties, developing copper ore.

A little oil prospecting southeast of Dillon has resulted in finding strata of shale, bearing paraffine and asphaltum, which is said to be similar to the surface oil showing at Florence, Colo.

Dillon, Aug. 11.

FERGUS COUNTY.

Wright & Wright have men at work prospecting the Golden Discovery group, at North Moccasin. On this claim ore has been exposed in several open cuts and a 50-foot tunnel is all in low-grade cyanide ore.—Russie & Schiller are working on the White Elk claim, adjoining this group, and have some cyanide ore developed at the surface.—Graham & Wareham are driving a tunnel on the Stand Pat claim to tap a body of ore opened in a shaft higher up, which carries average values of \$5 per ton.—Wareham & Sutor are prospecting on the Mountain Rat claim, which shows some cyanide ore at the surface.

The Eagle mine, near Lewistown, has been bonded by Ornbau & Barnes to G. W. Tower of Butte at \$50,000 for five months. Considerable development has already been accomplished on the Golden Eagle and the Eagle Extension claims, and some high-grade ore has been taken from them. The ores are smelting ores carrying values in gold, silver, lead and copper, but the values in gold are by far the greatest. The bonding parties agree to maintain men at work on the ground.

JEFFERSON COUNTY.

J. G. Mizer, vice-president of the Eva May M. Co., operating near Basin, says that the Eva May has passed the prospect stage and is a mine. It has a shaft 650 feet deep and a solid body of pyritic ore 3 feet wide, carrying copper, silver and gold. Considerable of it assays as high as 13% copper. The company is shipping concentrates steadily, and has expended about \$340,000 in the purchase and development of the mine.

The American S. & R. Co. of Helena has bought a one-ninth interest in the

Montana Central and Monarch lode mining claims, paying for it \$1677.67. The property belonged to the Largey estate.

LEWIS AND CLARKE COUNTY.

J. Onwiler and T. J. Burt have five claims on iron veins near Butler and are down 14 feet on a vein 10 feet wide. It carries 43% iron, \$1.20 gold and 90 cents silver.

D. Panches is down about 140 feet on his copper mine at Butler and finds chunks of ore which are almost native copper, for some of it carries 80%. This ore is now shipped to Butte.

The owners of the Cosmopolitan mine, near Helena, propose to prospect the lead with a diamond drill to a depth of 2000 feet. The claim is owned by J. Cruise, T. H. Carter, J. B. Clayberg and others.

MADISON COUNTY.

The Little Darling mine, on Old Baldy, near Sheridan, is to be operated by J. E. Hatfield and S. Thomas. This mine has produced some rich rock and is developed by several tunnels and a shaft.

The Finch Bros., who own a little gold mine in Norwegian gulch, near Norris, are said to be taking out about \$14,000 daily. The mine consists of a vein of gold-bearing quartz between 5 and 7 inches wide. The two brothers mine out the ore, crush it in a hand mortar and then separate the gold in a gold washing pan.

The Clipper and Boss Tweed mines, at Pony, have been bought by the Amalgamated Copper Co., represented by J. Gillie, at a price said to be about \$1,000,000.

The ore body has been struck in the winze which R. A. Bell has sunk from the fourth level of the East Pacific mine at Winston, and it is as rich and as large as in the upper levels. Preparations are being made to increase the shipping facilities.

PARK COUNTY.

The Bald Butte Co. at Jardine has a dividend record of \$1,042,048. The mine originally cost \$10,000. About half a ton of ore was taken from the mine during July, assays from which run from 300 to 1900 ounces gold.

SILVER BOW COUNTY.

It is reported that ore has been struck in shaft No. 3 on the McQueen placer, at Butte, by F. Farrell. The shaft struck the solid formation at a depth of 95 feet, and is now down about 200 feet. The vein struck is said to be about 5 feet wide, having in it several streaks of copper glance.

NEVADA.

ELKO COUNTY.

The White Rock G. M. Co. of Elko, of which W. D. Higginbotham is Supt., will begin operations on its property soon. The company has both quartz and gravel ground, and proposes to do considerable development work this season.

LINCOLN COUNTY.

The Southern Nevada M. & M. Co., is building a 7-stamp mill at the Pegrew group of mines at Searchlight. The owners of the property are Buffalo and New York capitalists. F. C. Pegrew is superintendent.

LYON COUNTY.

The Bluestone copper mine in Mason valley, owned by Butte, Mont., men and managed by C. C. Batterman, is worked through a tunnel. The ore carries gold and silver, but copper predominates. The company employs about 200 men in the mine and smelter, the latter reducing an average of 120 tons daily.

Benton & Kennedy have sold the Imperial mine and mill, in Kennedy district, to an Eastern company represented by C. S. Wynn of New York.

ORMSBY COUNTY.

R. Logan has bonded the Quill mine, near Carson, for \$13,000. This mine is a copper proposition, the ore carrying considerable gold. It is understood that the property will be developed at once.

WASHOE COUNTY.

G. H. Wedekind and J. Sparks, owners of the Reno Star mine at Reno, have been put under a temporary injunction restraining them from exploring or taking ore out of the Desert King M. Co. ground, the Bell claim. This is the ground given to the Reno Star owners by the Nevada State trial court decision.

R. W. Summers has declined a big offer for the Forlorn Hope mine at Olinghouse. He is down 180 feet in 18 inches of \$108 sulphide ore. — Proctor & Allen are crosscutting at a depth of 170 feet. They have passed through 33 feet of low-grade ore without reaching the hanging wall. — It is reported that a strike has been made on the Woodchopper mine, owned by Sheehan, Sheehan & Nelson.

E. A. Norcross and others of Reno have incorporated the Gold-Copper Ex. Co., with office at Reno. The company has bought the Norton mine, a free-milling gold ledge, at Pyramid. For some months sinking and crosscutting on the ledge has been done.

WHITE PINE COUNTY.

The Sapho M. Co., at Ely, is reported to have made a strike in their new tunnel, the ore showing copper carbonate and assaying up to 21.5% copper. F. E. Wilson, manager, reports from 15 inches to 2 feet of an ore streak in a 10-foot vein, with a carbonate of iron as a gangue. The management propose to sink on this ore to develop sulphides which will justify the building of a pyritic smelter.

The Dexter mine at Tuscarora has shipped gold bullion valued at \$5700, and cyanides worth \$2200 more, from the last fifteen days' mill run. The production for the first half of the month amounted to \$6800, making the total for July over \$15,000. Sec. G. E. Airis at Salt Lake, Utah, says the output is a gain of \$4000 over any previous month's record.

NEW MEXICO.

DONNA ANA COUNTY.

The Ajax M. Co., with office at Las Cruces, has been incorporated, with \$500,000 capital. The directors are P. Moreno, R. C. Hatton, H. B. Lane, R. L. Young of Las Cruces and O. C. Snow of Mesilla Park.

GRANT COUNTY.

Bates & Maroney have completed their contract for sinking 50 feet on the mine of the Silver City Turquoise Co. at Burros. Crosscutting will be done at the 50-foot level. The company is also sinking a winze from the 80-foot drift.

RIO ARriba COUNTY.

The Las Tusas M. & M. Co. of Michigan, L. L. Trout manager, have started operations developing a group of claims at Bromide.

SAN MIGUEL COUNTY.

Fifteen mining claims near Las Vegas have been bought by J. P. Hill, G. Dodge, G. H. Waterbury, H. P. McIntosh and associates of Denver, Colo. The claims cover a tract of 320 acres and were sold by A. R. Quinley and J. A. Baker. The rock bears copper ore and one of the conditions of the sale is that a large mill shall be built to work the ore by a leaching process.

OREGON.

BAKER COUNTY.

The Belcher mine, near Alamo, has been bought by Eastern people for, it is said, \$75,000. G. W. Daines of Danville, Ill., is president and principal stockholder. Of the six claims in the mine, only the Belcher and the Gold King have been developed.

The Gallagher mine, in the Burnt River district, near Baker City, has been bonded to J. Harrington for, it is said, about \$50,000, on ninety days' time.

The Rachel mine and five adjoining claims, owned by the Gold Ring M. Co., have been bought by L. M. Kent of Danville, Ill., for \$10,000 cash. This group is near the Virtue mine at Baker City. The Rachel is an old property which has been worked for a number of years.

J. Gallagher has bonded the Gallagher mine, in the Burnt River district, near Baker City, to J. Harrington, for ninety days, at \$5000. The mine has not been operated for three years.

GRANT COUNTY.

The Dixie M. & S. Co., Hauser, manager, at Dixie Butte camp, has bought the smelter at Sumpter and has moved it to Dixie Butte. The company is opening a copper mine.

JACKSON COUNTY.

An English company, represented by Wm. Bailey of Palmer creek, has bonded a portion of Missouri Flat, near Jacksonville, with the intention of working it as a big placer proposition.

G. L. Davis, J. B. Dent and E. Bebler have incorporated the Rogue River Quicksilver M. Co., to operate quicksilver mines in Jackson county. Its capital stock is \$250,000 and place of business Medford.

JOSEPHINE COUNTY.

The old quicksilver mines near Cinnabar, south of Grant's Pass, have been bonded by I. Humason and H. Cowgill, who propose to operate the mines.

At the Mountain Lion, near Grant's Pass, another pay streak of very rich rock has been found. — The Baby mine, on Jump Off Joe, is producing ore which goes \$50 to the ton. A 2-stamp mill has just been erected on this property. — The Exchequer and Rising Sun mines on Applegate river have been equipped with a new hoisting engine.

LANE COUNTY.

The Lucky Boy M. Co. of Eugene proposes to begin work at once on its electric power plant on Blue river. The plant is estimated to cost nearly \$30,000, and is designed to supply power to other operators as well as operate their own mine and mill.

WALLOWA COUNTY.

Hibbs & Barton have bonded a part of their group of copper claims on the Im-

naha to the Fargo company, represented by L. D. Lively, for \$15,000, \$2500 down.

SOUTH DAKOTA.

LAWRENCE COUNTY.

A semi-official announcement has been made by the Homestake Co., concerning the operations of their 1200-ton cyanide plant at Lead, on a three-months run on the mill tailings. The plant treated 1200 tons daily, the average value per ton, \$1.50. Of this about 70%, \$1.05, was saved. It is estimated that the company nets \$1000 per day from the plant. The tailings are first concentrated, the concentrates being sent to the smelter. There are fourteen mammoth tanks in the cyanide plant, each with capacity of 600 tons. It requires from six to seven days for treatment, two tanks being filled and emptied daily.

The American M. Co., Ragged Top, J. Madill, Supt., which is drifting from the shaft on Spearfish creek to intersect the shaft put down at Ragged Top, has already followed the lower Cambrian ore measures for a distance of 1606 feet. The distance between the two shafts is 6000 feet and in order to maintain the present progress large pumps will be added and another 300 H. P. boiler will be installed. The present inflow of water that has to be pumped is said to be 1000 gallons a minute.

PENNINGTON COUNTY.

T. P. Williams of Hill City has shipped four carloads of spodumene to New York. The rock carries from 3% to 6% of lithia.

The Deadwood Standard G. M. & M. Co. has been incorporated to build a 200-ton cyanide plant at Ragged Top and to work a mine bought from E. Hanschka of Deadwood, who retains an interest.

UTAH.

BEAVER COUNTY.

The Gold King mine, in Star district, has been sold by Forgie Bros. to Morrison & Bettles of Salt Lake City, who have turned the mine over to P. A. H. Franklin for the Bluebird Co.

BOX ELDER COUNTY.

For the development of the Homestake group of seven mining claims, situated in Park Valley district, the Excelsior G. M. & M. Co. has been incorporated in Salt Lake City, capital \$25,000, with W. A. Hodges president and F. Hodges secretary.

GRAND COUNTY.

The Pilot Mountain M. & M. Co. has been incorporated; capital, \$15,000. S. C. Carpenter is president and C. L. Bryson secretary. The company owns the Snow Bank and Lucky Boy claims at Basin City.

SALT LAKE COUNTY.

The Leona mining claim at Bingham has been bought by the Ben Butler M. Co. from T. B. Beatty for \$13,000. The mine, which is patented, adjoins the original holdings of the Ben Butler on the south.

SUMMIT COUNTY.

The City Rocks mine at Alto has been bought by M. Dusseldorf, A. Hanauer, Jr., and associates of Salt Lake City from J. B. Haggin of New York, the estate of R. C. Chambers and their associates. For several years the City Rocks group has been shipping ore containing copper, silver and gold, with some lead, but the output has been limited.

The Bonanza Con. M. Co. has been incorporated in Salt Lake City to operate the Dodge group of fourteen claims lying south of the Little Bell at Park City. The company is capitalized at \$150,000. W. H. Dodge is president and R. B. Hughes secretary. Material is already being delivered, and the tunnel, now in 387 feet, will be pushed to the vein, about 100 feet farther on, from which very rich ore has been taken.

TOOELE COUNTY.

The report of C. H. Dern, assistant manager of the Con. Mercur G. M. Co., shows that during a period of eleven months ending June 30 last the company mined and milled 238,295 tons of ore. From this the product in gold bullion was \$1,493,993.80, out of which dividends amounting to \$235,000 were paid, and a balance amounting to \$273,809.96 was carried forward. It is further shown that in the milling of the ores a saving was made of \$5.18 per ton, while the contents of the tailings were reduced to 95 cents, with a gross value of \$6.13 per ton on the crude ore. The extraction of ores, the milling of them, the paying of salaries, etc., entailed a cost of \$3.18 per ton, or \$918,270.40, which left the company a net profit of \$2. In addition to the operating expenses, \$61,553.87 was paid out for improvements on the mines and mills, while at the closing of the report the company had in stock in its storerooms, supplies, etc., of the value of \$99,398.72.

UTAH COUNTY.

The American Copper M. & M. Co. has

been incorporated, with T. R. Cutter as president and J. Y. Smith secretary and treasurer. The capital stock is \$250,000, and the company owns five claims located near Simpson Springs. The ore carries a high per cent of copper and some values in gold. W. F. Butt is manager.

WAYNE COUNTY.

E. T. Wolverton describes a lead and silver proposition on Miners' mountain, 25 miles from Loa, as lying in carbonate deposits similar to those at Leadville. Assays give values of \$50 and upward in silver and lead.

N. L. Sheffield of Loa states that he and J. Grant have bonded the Silver Gance group of galena mining claims to E. J. Wolverton for \$10,000. Ore from this mine has assayed 39% lead, 3.4 ounces silver and 80 cents gold per ton.

WASHINGTON.

FERRY COUNTY.

The Phil Sheridan mine at Sheridan, near Republic, operated by J. Cronin, is operating satisfactorily. The shaft is down 100 feet and shows an ore body 4 feet in width. The ledge is considered to be wider and more uniform in value at the present level than at the surface.

WYOMING.

CARBON COUNTY.

The Haggarty-Jordan C. M. Co. has bought the Vulcan group of claims at Grand Encampment. The development on this group has been considerable and copper ore running as high as 40% has been opened.

FOREIGN.

BRITISH COLUMBIA.

The Prospectors' Exchange at Nelson reports that on the Camborne mines, Lardau district, bonded by the Rosenberger Syn., twenty men are now employed on development work. There are six veins from 8 to 45 feet in width, with ore averaging from \$6 to \$60 per ton. — Operations have been resumed at the White-water mine, Salmon. There are now fifty men on the pay roll. Six hundred tons of ore were shipped to the Trail smelter during July. — The Tamarack group, Slokan district, is being developed by Spokane parties. It is reported that this mine has a 16-inch wide pay shoot of dry ore. Twenty tons of ore shipped by the owners some time ago netted \$1200. — A 10,000-foot aerial tram is to be built to connect the Silver Hill and other properties with a shipping point on Crawford bay, Ainsworth division. The tram will have capacity of 225 tons per day.

Nelson, Aug. 8.

The Wonderful mine, in the Slokan, has started shipping ore, W. W. Warner stating that forty-three tons have been sent to the smelter which he estimates will average \$70 or more to the ton.

The Onondaga mines, located on Champion creek, near Rossland, as the product of a twelve days' run on the 10-stamp mill recently completed, have \$2000. Everything taken out was sent through the mill and the material thus treated included, according to T. James, the manager, more waste, gravel and earth than it did ore. On the Maud S. considerable work has been done and about 6000 tons of good grade, free-milling ore are now blocked out.

B. C. Lowry says that there are six hydraulic plants now in operation in Atlin, and three or four other hydraulic plants are to be installed during the summer.

The second clean-up of this season at the Con. Cariboo hydraulic mine, at Bullion, J. B. Hobson manager, has been shipped. Its value is stated to be about \$115,000, making about \$315,000 to date this season.

F. M. Wells of Republic, Wash., who has a bond on the Kingston group at Hedley City, is arranging to develop the property under his personal supervision.

MEXICO.

(Special Correspondence). — The group of mines known as the Vacas and San Marcos, located 60 miles southeast of the city of Durango, was acquired several months ago by B. Clark Wheeler of Denver, Colo., and associates, who have organized the Vacas-San Marcos M. Co., to equip, develop and operate the properties. The holdings embrace 500 acres of surface. The property has been operated for years by rather crude methods. It is opened by shafts which reach 800 feet depth; and it is estimated that there are about 400,000 tons of ore in sight above that level. The new company has started a concentrating mill to operating, which is handling sixty tons of ore per day, making a product that runs 66% lead and 97 oz. to 100 oz. silver. Orders have been given for machinery to construct a new mill capable of handling 250 tons of ore daily. Mr. Wheeler states that the output of the old mill amounts to \$35,000 per month, the

mining and milling expenses amounting to about \$10,000 per month.
Durango, Aug. 5.

THE KLONDIKE.

Fifty-cents-to-the-pan gravel has been found on the lower Hunker benches. The new find adds to the prospects of that section.

A strike has been made on the ridge road, about 22 miles from Dawson. It is a smelting ore carrying copper and gold in paying quantities.

Personal.

F. R. HINDS of Butte, Mont., is in Grass Valley, Cal.

E. C. VOORHIES, of Jackson, Cal., is in San Francisco.

HENRY BRATNOBER of London is at Missoula, Mont.

G. W. THOMAS of Angels, Cal., is in Idaho City, Idaho, examining mines.

B. CLARK WHEELER returned to Denver, Colo., from Durango, Mexico.

L. E. AUBERY, State Mineralogist, is visiting Placer and El Dorado counties, Cal.

C. J. MOORE, lately in Silver City, Idaho, has returned to Cripple Creek, Colo.

J. HIGGINS of Reno, Nev., is in charge of a large cyanide plant at Guanajuatillo, Mexico.

A. CHESTER BEATTY, M. E., recently returned to Denver, Colo., from a trip to Mexico.

E. PARISH, of Newport, R. I., is manager of the Newport M. Co. mine at Fay, Nevada.

PROF. W. O. CROSBY of Boston, Mass., has been examining the mines of Silverton, Colo.

P. T. FARNSWORTH, manager of the Bullion-Beck mine at Park City, Utah, is in Alaska.

W. S. CHAPMAN of San Francisco has recently been examining mines at Silver City, Nev.

W. A. KOCH has resigned as Supt. of the Emery mines at El Dorado, Calaveras county, Cal.

W. T. ST. AUBURN, formerly Supt. Gladstone mine at French Gulch, Cal., is in New York.

N. H. NICHOLSON of Denver, Colo., is examining copper properties in Chihuahua, Mexico.

J. A. MARSHALL of London, Eng., is in charge of the Cherokee mine, Chihuahua, Mexico.

L. B. WICKERSHAM of Portland, Or., has returned from a professional trip to Seward, Alaska.

W. CHOATE, M. E., of Detroit, Mich., has recently been examining copper mines near Libby, Mont.

W. H. ADAMS, manager of the Rambler-Cariboo mine of British Columbia, is in Spokane, Wash.

F. G. GOGGIN, Supt. of the Calumet & Hecla mill department at Houghton, Mich., has resigned.

W. S. HALL, Professor of Mining at Lafayette University, Easton, Pa., is in Cripple Creek, Colo.

A. H. ELITMAN, geologist, of Minneapolis, Minn., is examining mines in Butte and Yuba counties, Cal.

J. G. MCBRIDE, of New York, manager of the Verde Apex Copper M. Co., is at the mine, Jerome, Arizona.

R. N. COWAN of Montana has been appointed amalgamator of the U. P. Co. mill at Salmon City, Idaho.

S. E. CHAMBERS of Park City, Utah, is in charge of the leaching plant of the Ophir Co. at Stateline, Utah.

W. H. FULLER of Los Angeles, Cal., president of the Osceola M. Co. at Forest City, Cal., is visiting the mine.

R. C. GEMMELL, E. M., of Salt Lake City, Utah, has gone to Parral, Chihuahua, Mexico, for a large mining syndicate.

B. C. SOULE of Oakland, Cal., and C. E. Sloane of San Francisco have gone to Nogales, Mexico, to examine a mining proposition.

P. H. WISEMAN, manager of the Shannon copper mine at Clifton, Ariz., has returned to the mine after several weeks' absence at New York.

Recently Declared Mining Dividends.

Commercial Paragraphs.

THE Locomobile Co. of the Pacific has moved its office and warehouses to No. 1622 Market St., San Francisco.

J. GEO. LEYNER, Denver, Colo., manufacturer of air drills and compressors, is putting in a stock of his machines at 242 South State St., Salt Lake City, Utah, where J. H. Sanborn will be in charge.

McFARLANE & Co., Denver, Colo., recently shipped concentrating machinery to the Hunter Creek mill, near Aspen, Colo., and six electric hoists to the Arkansas-McAllister Coal Co., at Hartford, Ark.

CHARLES WALLACE has produced a stamp and grinding mill which has some of the features of the stamp, combined with those of the arrastra. He has organized the New Era Machinery Co., Denver, Colo., to manufacture the machine. Associated with him are E. Truett, F. E. Bush and C. F. DuBois.

THE Colorado Zinc Co., interested in which are Henry E. Wood, A. C. Beatty and others have plans for erecting a mill in Denver, Colo., to operate on heavy, base, sulphide ores. The chief functions of the mill will be crushing, sizing and effecting a separation of the iron from the zinc material. Jesse Scooby is engineer in charge of the construction.

THE Detroit Leather Specialty Co., Detroit, Mich., announces that it has "the only plant in the world making a specialty of hydraulic leather packings." The company has special machinery, designed and built for special work, and invites correspondence from those interested in getting the best material at the lowest price.

THE Wisconsin Traction, Light, Heat & Power Co. of Appleton, Wis., recently placed quite a large order for Victor turbine water wheels with the Stilwell-Bierce & Smith-Vaile Co. of Dayton, Ohio, consisting of two units of wheels for driving the main plant, each unit containing three pairs of 42-inch Victor turbines mounted on horizontal shafts. These wheels will develop 3200 H. P. Two 24-inch horizontal wheels will also be furnished for driving the exciters. The gate work will be of the patented draw rod type, which places all gears on the outside of the flume, where they can have attention, and where they can work in oil, replacing the style of gate work where the gears run in water.

Catalogues Received.

THE Globe Iron Works of Stockton, Cal., have issued a little catalogue descriptive of the Globe battery stem guide, which they manufacture, for stamp mills. They will be pleased to mail the catalogue on application.

THE Rockwell Engineering Co. of New York have issued Catalogue C on Furnaces. It handsomely illustrates a few of the many types of furnaces, designed for every variety of service, which the company is prepared to supply. The Rockwell Engineering Co. will be pleased to mail the catalogue on request being made at their office, 26 Cortlandt St., New York.

Books Received.

"How to Become a Good Mechanic," by John Phin, 16mo., 65 pages, second edition, is a pocket volume for beginners who are learning a trade. It is intended as a guide to self-taught men, to instruct them

how to carry on a course of self-instruction which will enable them to rise higher in the trade. Published by the Industrial Publication Co., New York. Price 25 cents postpaid.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING AUGUST 6, 1901.

679,933.—VENTILATOR—P. Abrahamson, S. F.
680,106.—SKIRT SUPPORTER—A. M. Adams, Portland, Or.
680,113.—MOUTHPIECE—A. Bergman, Sacramento, Cal.
679,875.—CONVEYOR—H. W. Blaisdell, Yuma, Ariz.
680,119.—DENTAL FORCEPS—F. A. Brewer, Jr., Waterville, Or.
679,942.—PENCIL SHARPENER—E. Burke, Lakeview, Or.
679,943.—PRESERVING FRUITS—F. Butcher, Healdsburg, Cal.
679,880.—RAILWAY SWITCH—Cantrell & Empey, Spokane, Wash.
679,946.—FLY ESCAPE—A. J. Collar, Yreka, Cal.
679,951.—REIN HOLDER—C. A. Conger, Oakland, Cal.
679,880.—BAILER CONNECTION—C. I. Dorn, Bardsdale, Cal.
680,029.—LUMBER CONNECTION—J. E. Dubray, Madera, Cal.
680,141.—DRIVING SHINGLES—Gibbard & Anderson, Eureka, Cal.
680,033.—MOTOR—K. Gore, Berkeley, Cal.
680,039.—WINDMILL—K. Gore, Berkeley, Cal.
679,144.—CLEANING COMPOUND—J. Hammer, Tacoma, Wash.
679,982.—SLIDING DOOR—J. Handschumacher, S. F.
679,986.—REFRIGERATOR CAR—J. Hommel, Los Angeles, Cal.
680,155.—LUBRICANT—W. M. Jones, S. F.
680,053.—FLY COVER—Madigan & Crocker, Seattle, Wash.
680,175.—GAME—M. Reinhart, Portland, Or.
680,044.—REFRIGERATOR—J. R. Simms, Linden, Cal.
680,005.—HOOK—P. B. Southworth, Mayville, Or.
679,928.—TIE KETTLE—C. E. Warren, Los Angeles, Cal.
680,104.—DESK LEAF SUPPORT—G. H. Wyman, Los Angeles, Cal.
34,887.—DESIGN—J. A. Kirkham, Portland, Or.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MEANS FOR PRESERVING FRUITS AND THEIR JUICES.—F. Butcher, Healdsburg, Cal. No. 679,943. Aug. 6, 1901. This invention is designed to prevent the decay or fermentation of the juices of fruits or of fruits or kindred products in a liquid or semi-liquid form after these products have been hermetically sealed, and where it is desirable at any time to break the seal and remove a part of the preserved contents. My invention consists in a means for sterilizing or deodorizing the air or vapor that may be employed to the barrel, or other receptacle containing the preserve, whenever any of its contents are removed, and this is effected by consuming the oxygen of the air and sterilizing it as it enters the vessel to fill the vacuum produced by drawing out the contents.

FLY ESCAPE.—A. J. Collar, Yreka, Cal. No. 679,946. Aug. 6, 1901. The object of this invention is to provide an inexpensive portable fly escape that can be inserted in any screen door, or screen window opening, and requiring little or no mechanical skill to set it in position. It includes a horizontal expandible concave base having transverse openings or outlets, a screen surface with a transparent section or continuation, and means for attaching the escape to an opening or like aperture.

VENTILATOR.—Peter Abrahamson, San Francisco, Cal. No. 679,932. Aug. 6, 1901. This invention comprises a ventilator box or air shaft divided by longitudinal vertical partition into ingress and egress air passages, with means for deflecting the air respectively downwardly and upwardly in these passages. A damper forms a part or continuation of the said partition, and is turnable to cut off the circulation.

Thurman's Portable Forge.

The accompanying cut illustrates an Improved Portable Forge recently patented to Wm. C. Thurman of Fresno.

It comprises a hearth of brick or clay having a firepit extending its full width and open at the ends; a plurality of tuyeres entering the pit; separate air passages for each tuyere, connections of these passages with the main blast pipe

of the blower; and a wing valve in the blast pipe whereby the supply of air to the tuyeres may be regulated.

The divided air inlets and the transverse fire pit permit of a large saving in coal over forges of the ordinary type where extended heating surface depends on the depth of the fire. Thus one is enabled in a small forge of the Thurman type to heat and weld large bars, axles, etc., such as require a considerable longitudinal surface to be subjected to the fire.

Latest Market Reports.

SAN FRANCISCO, Aug. 15, 1901.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 58½c (1000 fine); San Francisco, 58½c; Mexican dollars, 47c San Francisco, 45c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c. London: £65 8s 9d per ton.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £11 13s 6d per ton=2.52 cents per lb.

SPELTHER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb. lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13½c.

IRON.—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$27.50; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30½c; less, 31c; bar tin, 31c, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 7½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½c.

PHOSPHORUS.—F. O. B. New York 50¢ @ 60¢ per lb.

ASSAY LITHARGE.—San Francisco, 10c per lb., small lots.

BISMUTH.—New York, 3½c, \$2.25 50-lb. lots; San Francisco, \$2.50 to \$2.75 lb. lots.

PLATINUM.—San Francisco, crude, \$19 per oz.; New York, \$20.50 per Troy oz. FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

TUNGSTEN.—New York, 3½c, 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50¢ @ 60¢ per lb.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 9½c per set; 14 oz., 40s., 8½c.

OILS.—Lined, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's bbls., 60c; cs., 65c; No. 1 bbl., 50¢ @ 52½c; cs., 55¢ @ 57½c.

CHEMICALS.—Cyanide of potassium, 97%—98%, jobbing, 31½¢ @ 32½¢ per lb.; carloads, 29¢ @ 30c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66¢ B, 2c per lb.; soda ash, \$1.90 per 100 lbs.; hyposulphite of soda, 2½¢ @ 3c per lb.; blue vitriol, 5½¢ @ 6½¢ per lb.; borax, concentrated, 7¢ @ 8c per lb.; chlorate of potash, 12¢ @ 13c; roll sulphur, 6c; alum, \$1.90 @ 2.00; flour sulphur, French, 2½¢ @ 2½c; California refined, 1½¢ @ 2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3¢ @ 4c per lb.; Cal. s. soda, bbls., \$1.00; sds., 95c per 100 lbs.; chloride of lime, spot, \$2.50 @ 2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

SITUATIONS WANTED.

WANTED.—Position by a young man with several years practical experience in steam and electrical engineering. Address A. F., care this office.

WANTED.—POSITION AS HOISTING ENGINEER, Fireman or General Mechanic. State wages. J. E. MURRAY, care of Sulpho-Saline Bath Co., Lincoln, Nebraska.

WANTED.—A POSITION AS ASSAYER AND general assistant, if desired. Mexico preferred. Ten years' experience in general mining. Two years managing mines in Mexico. Have practical knowledge of the language. References furnished. Box 32, Mining and Scientific Press.

MINING ENGINEER, four years in Johns Hopkins' University, thirteen years miscellaneous work in West Virginia, desires work in the West. Address X Y Z, Mining and Scientific Press.

MILLMAN WANTS POSITION. Has had 14 years' experience. Capable of taking charge of stamps or Huntington mills. Understands thoroughly amalgamating, concentrating, and the care of mills—high or low-grade propositions; fast crusher and close sizer. Reference given. Address "millman," care Mining and Scientific Press.

A Civil and Mining Engineer (member American Society of Civil Engineers, member American Institute of Mining Engineers), at present general manager of a Western gold mining company, desires change. Will go anywhere. Examining or reporting, exploration work or operating. Address Box 264, Grangeville, Idaho.

Position as Superintendent or Millman by one experienced in wet and dry crushing, cyaniding plate amalgamation assaying, and melting of bullion. References furnished. Address B, care Mining and Scientific Press.

WANTED.

TAILINGS, SLIMES AND DUMPS WANTED. Correspondence invited respecting Refractory Gold Ores. REX, care Mining and Scientific Press.

WANTED IMMEDIATELY. A First-Class, Reliable Carriage Blacksmith.

One thoroughly competent to take charge of a shop. Excellent chance for the right man to better his position, if satisfactory. Answer by letter to P. C. JURS, 1109 Van Ness Ave., San Francisco.

FOR SALE.

FOR SALE.—1000 to 5000 Shares of the Consolidated St. Gothard Mining Co. of Nevada County, AT 30 CENTS PER SHARE. Address N. BOYAR, 429 O'Farrell St., San Francisco, Cal.

FOR SALE.—Two Claims with a Large Body of Ore in Sight, Averaging \$10.

Easy terms. Small amount of development. Address Box 100, care this office.

BELTING AND PULLEYS.

We can save you 50% on guaranteed Belting secured from mills which we dismantle. All sizes of wood pulleys that are as good as new and guaranteed.

Send for Catalogue No. 37.

THE S. H. SUPPLY CO., 22nd and Larimer Sts., DENVER, COLO.

SECOND-HAND MACHINERY.

PULLEYS, SHAFING, BELTING, BOXES, BOILERS, ENGINES, HOISTERS, STAMP MILLS, RAILS, CABLE—all but little used.

THE S. S. MACHINERY CO., Sixth and Market Sts., DENVER, COLO. SEND FOR DESCRIPTIVE CIRCULAR.

FOR SALE. ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Bannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

OLD BUILDINGS and CRANES of

The Risdon Iron Works, SAN FRANCISCO, CAL.

FOR SALE, FOR REMOVAL, Consisting of machine shop, foundry and boiler shop buildings, suitable for these purposes or for warehouse or storage buildings. Proposals received now and up to August 1st.

QUICKSILVER MINE For sale on workably developed, equipped quicksilver mine. Small amount required to place on dividend-paying basis. Principals only. Address G. L., Mining and Scientific Press office.

SPECIAL NOTICE.

Capitalists and wealthy syndicates desire to purchase large operating gold and copper mines, at owners' bedrock prices, can most likely find what they want by corresponding directly with the undersigned. By doing so, buyer and seller can be brought together with the intervention of useless and undesirable promoters, brokers and middlemen. I have several very desirable properties now for sale. E. J. FRASER, 522-523 Parrott Building, San Francisco, Cal.

NOTICE.

Notice is hereby given to all parties not to use, manufacture, permit to be used or manufactured, any device employing the process of the ROBINSON ORE CONCENTRATOR or any infringement thereon, except by legal authority.

INTERNATIONAL MINING CO.,

H. C. ROBINSON, Inventor. CANTON, O.

A. M. DONALDSON & CO., Assayers and Waste Product Smelters, 1661 Larimer St., Denver, Colo.

Pay Cash for Mill Wastes, Iron Amalgam Chips, Gold and Silver Retorts, Old and Surplus Quicksilver, Gold and Silver Wastes. ZINC SHAVING MANUFACTURER. Fresh cut always in stock. TELEGRAPH orders solicited.

BRITISH COLUMBIA MINES.

Mines and prospects in British Columbia and the Northwestern States.

Free-milling Gold properties on very reasonable terms.

Excellent chance for profitable investment in legitimate mining.

Correspondence solicited.

Address ANDREW F. ROSENBERGER, P. O. Box 700, Nelson, British Columbia.

MINERS' AND PROSPECTORS' GUIDE.

REVISED THIRD EDITION.

Published by JAMES IRVING & CO., 128 N. Main St., Los Angeles, Cal.

Contains U. S. State and Territorial Mining Laws, as well as much useful information for miners and millmen.

Price 25 Cents.

OFFICIAL MANUAL OF CRIPPLE CREEK, FREE WITH THE

MINING INVESTOR. Write for sample copies and full particulars to the MINING INVESTOR, Colorado Springs, Colo.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the AMERICAN OIL AND REFINERY COMPANY will be held at the company's offices, Rooms 322-323 Parrott Building, 825 to 855 Market St. in the City and County of San Francisco, on MONDAY, the 19th day of August, 1901, at 1:30 P. M., for the election of directors for the ensuing year and the transaction of such other business as may properly come before the meeting.

J. C. ANTHONY, Secretary.

McGill University, Montreal.

CHAIR OF METALLURGY.

The Governors of McGill University invite applications for the Professorship of Metallurgy. Candidates for the appointment are requested to send their testimonials, with a statement of age, qualifications, etc., to the Secretary of the University, before September 1st. The duties of the post will commence October 1st. Full particulars of the work, salary, etc., may be obtained from the Secretary.

Placer Deposits.

Parties interested in placer deposits that cannot be successfully operated, owing to a lack of water, should communicate with THOMAS A. EDISON, Orange, N. J.

Quicksilver BY THE FLASK OR CARLOAD.

The Eureka Company, OF SAN FRANCISCO, 820 SANSOME STREET, - SAN FRANCISCO.

Quicksilver IN LOTS TO SUIT.

Send for Quotations. REDINGTON & CO., 23-25 72nd Street, SAN FRANCISCO, CAL.

INVENTORS, Take Notice!

L. PETERSON, MODEL MAKER, 544A MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

The above is an illustration of a First-Class Modern 10-Stamp Gold Mill.
For particulars, send for Catalogues.

“THE DANIEL BEST” 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,
16 TONS EACH,
or a total capacity of train,
48 TONS.

CAPACITY
OF
ENGINE,
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.
Estimates made for complete Steam Freighting Outfits. Address

JUPITER STEEL.

Appliances, Oil Well and Quarry Supplies. A location for Pacific Coast Plant No. 1 is desired. Address stating what you have to offer in way of Land, Buildings or Capital.

10 000 lbs. daily capacity sold at 18 cents.....\$1,800
10 000 lbs. cost at 3 1-2 cents.....350

Net profit per day.....\$1,450
Days per year.....300

NET PROFIT PER YEAR.....\$435,000

Equal to \$43.50 per share per year on 10,000 shares at \$100 each. They will be sold with a bank agreement that at a fixed date the bank will return whole of original investment, unless the stock has become saleable in open market for \$200 per share.

It certainly is very rare that a new invention is carried beyond the experimental stage and into practical use, by consumers of highest standing, before being capitalized and put on the market.

Users of the Jupiter Steel now number over 700, including the Navy Department, city of Boston, and almost every prominent maker or user of machinery. A recent order is for BATTLESHIPS RHODE ISLAND and NEW JERSEY. Address for information,

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

Mine Timber Framing Machinery.

By the use of the above machine any ordinary mechanic, with a helper, WILL DO THE WORK OF 20 SKILLED CARPENTERS, with much more accuracy. It will make the tenons equally true on round or square timbers, and the shoulders, sides and ends of the tenons will be parallel and true.

The design of this machine is such that ALL ADJUSTMENTS CAN BE MADE WHILE THE MACHINE IS RUNNING, and, consequently, can be done in a very short space of time.

Correspondence is solicited, and prices for complete outfit will be furnished upon application.

COLORADO'S LEADING MINE OUTFITTERS,
DENVER, COLO., U. S. A.

A Fireproof Roofing.

P & B Ready Roofing is as near to fireproof as any roofing can be. Prof. Morton of the New York Board of Underwriters says in his report:

"An intense hot anthracite coal placed on this material will cause it to burn around the coal as long as the coal retains its red heat, and when the coal loses this, as it soon does, the surrounding material ceases to burn. I was unable to ignite it with pieces of burning wood."

After the big fire in Lakeview, Oregon, May, 1900, Daly & Hall of that city write as follows:

"We expect to use 500 rolls of P & B Ready Roofing in rebuilding Lakeview this summer. The only business house in Lakeview saved in the recent fire was roofed with P & B Ready Roofing."

P & B Ready Roofing is an all-around roofing—it lasts—it stands any kind of weather or climate and can be used by anyone—is not hard to handle, nor difficult to carry, nor expensive to transport.

It is the only roofing experienced builders will have anything to do with. Send for booklet—address Dept. A.

PARAFFINE PAINT CO., 116 Battery St., S. F., Cal.

OUR PATENT WATER VAPORIZING ATTACHMENT

MEANS

A GUARANTEED SAVING OF 80 TO 90 PER CENT

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. O. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

SOLAR HOUSE LIGHTS

For houses not having gas or electric
light service, and for those that have,
but wish economy and independence.

Costs \$4.00 Per Light
EACH LIGHT LASTS A
LIFETIME

Gives a steady light, brilliant as electricity,
and whiter. Exceeds any town gas service in
existence. No complications; nothing to get
out of order. Simple as A, B, C. Handy as a
"candle"—jets can be carried around anywhere
in the house. Gas cannot escape, like from the
town mains. No smell, no smoke and no danger,
as with kerosene or gasoline. No accident
of any kind possible, and the whitest, steadiest
and richest light that is known.
Write us for particulars.

Bankers, Importers, Exporters and Commission Merchants.

Representatives and Agents of the principal Mining Companies in the State of Sinaloa and the dependencies of the Pacific coast in the States of Durango, Chihuahua, Sonora, Lower California and Jalisco.

ORE BUYERS AND EXPORTERS. - MINING SUPPLIES.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

FIRTH'S DRILL STEEL. USE THE BEST.

Has no equal in Hard Rock Drilling.

ABNER DOBLE COMPANY, GEN. AGTS.,
FREMONT AND HOWARD STS., SAN FRANCISCO.

Sold by Seattle Hardware Co., Seattle, Wash.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING. A 1-inch stream will furnish ample water for a 50-ton per hour machine. CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings. The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from $\frac{1}{2}$ to $\frac{3}{4}$ greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

WHAT OTHER PEOPLE SAY.

Report from "Wonder" Concentrator being operated by Cyclone Drill Company in connection with their prospecting drill at The Mining Congress:

BOISE, IDAHO, July 24th, 1901.

GENTLEMEN:—We have the drill shipped July 1st set up and in operation on High School lot in heart of city and are attracting more attention than any other one exhibit. I came here from the South Bo'se ground where we have the first drill and pan sent out in operation. The drilling is very hard, but the machine is doing good work, and the pan perfect work. It saves everything. All the panning I have done after it, I have failed to find a color where the pan has been properly operated. The combination being new and the discharge from the drill very strong, some gold went over in the first two holes, but it was not fault of pan. From the holes put down after I got on the ground, the tailings do not show a color, and I panned them thoroughly.

Yours very truly,

C. W. PURSELL.

The Mine Freight Costs.

The business of transportation is a modern science developed from the modern improvement made by engineering invention in the means of transportation. Originally—and, indeed, until the invention of the steam railroad—the business was based on gaining a profit over the cost of giving the service. The modern business is based on making the profit gain from the value of the service to the served. Originally the kind of the production transported, its market value, the margin of seller's profit, did not make the basis of charges for transportation. Now these things do determine the charges and the flat cost of the transportation is made subordinate to them.

Mining is exceptionally dependent on transportation by reason of the remoteness of the mines from the centers of population. As a cost item against production, transportation charges are now of more importance than ever before. The reason for this is lowered metal selling prices and higher unit production costs due to working poorer ores.

Mine operators are not backward in appreciating the condition. The problem to them is the determination of the commercial lines on which a reduction of freight costs to the economic minimum can be made. The statement above of the basis on which

certain charge for transportation to a refinery. The mine operator figures that, if the refining be done at the smelter, pure copper can be shipped instead of matte, and the freight charge per pound of copper

transportation. Nevertheless, it is the operation of this law which discourages the application of economies which have for their primary object the reduction of transportation costs.

While this is the condition of the establishment of freight costs of mining, the subject should not be passed as something that can not be helped, but should be carefully studied with reference to all the operative costs of each particular mining enterprise. There is lack of recorded detailed data concerning mine freight costs, particularly in connection with western metal mines. Of iron and coal freight costs, such detailed data have been recorded. Possessing it, the iron and coal mine operators have been able to effect economies in transportation costs. Finding out first just what freight service cost, they made the economy by starting to serve themselves. They built and owned some of their own transportation service.

The metal miners of the western half of the United States are not as favorably situated as were the coal and iron miners of the East. They can not all build transportation facilities, or at least cannot build all the transportation facilities they need. They can, however, get the data of freight charges they are paying. They can get the data of the flat cost of the service they are paying for. With this knowledge, they have in their possession the same tools with which the coal and iron

A Modern Submarine Drill Boat. (See page 78.)

cut in two and half saved. The figuring of saving may be correct, but the mine operator having made it is not permitted to take it. The transportation service takes it by the simple expedient of making the freight charge for pure copper twice what it is for copper matte containing only 50% of copper. It

least cannot build all the transportation facilities they need. They can, however, get the data of freight charges they are paying. They can get the data of the flat cost of the service they are paying for. With this knowledge, they have in their possession the same tools with which the coal and iron

Front View of Engine and Pump.

Rear View of Engine and Pump.

freight charges are made shows the difficulty involved in making the determination. It resides not in the making of the economies which will reduce the quantity of service required, but in the retention of the money saving that the reduction of the quantity to service should bring. To illustrate this, copper matte containing 50% of copper and 50% of sulphur pays a

may be, and often is the fact, that the copper matte, owing to its gold and silver content, is worth more per unit of weight than pure copper; but that is not permitted in this case to affect the charge.

Illustrations can be multiplied indefinitely. The simple statement of one shows the economic absurdity which custom has made a commercial law of

miners and workers made their freight cost economies. The failure to have this knowledge has made futile the efforts of the petroleum producers of California to reduce their freight costs of production.

There is a distinction that should be observed. It is knowledge of the facts in units of the engineer's measuring stick—dollars—that is of first importance.

STATE MINERALOGIST AUBURY of California is initiating an experiment that it is to be hoped will prove such a practical success that it will be continued as incidental to the operation of the State Mining Bureau. He is offering the service of the Bureau without charge to experienced mining laborers out of employment and to mine operators in need of such workmen. While not strictly an employment office, the service given will effect the same purpose. It is difficult to see where the innovation will in any way detract from the object sought in the establishment of the Bureau. On the other hand it will certainly tend to bring the work, and accumulated technical data of the State's mining industry, close to all the men who are connected with the mining industry. Its ultimate influence on the relation between the mine operators and employes would seem beneficial rather than otherwise. As an attempt to make a public office directly useful, and to bring it in closer touch with industry, it is to be commended and endorsed.

THE rage for big things in mines is probably responsible for the much misused and hard-worked expression "group of mines." As commonly said, it seldom means what the words say. What the users of the phrase really mean would be more exactly said by the phrase "group of mining claims," and would be more simply said by the use of the single word "mine." Single mining claims or single mines seem to be considered too small to be mentioned in this age of big things. Nevertheless the mine may be, and really most often is, a single claim; and if in several claims in common ownership, is yet one mine. The custom is through adding the other claims, to obtain a big extent of surface, that to uncritical thinking will seem the same as if more and bigger mines. Aside from the sentiment that appeals most successfully from the interest of promoters of prospects, who would sell half a mine as if it really were half a dozen mines, there appears no reason for the misuse of the words. The "Tom Jones group of mines" is really only "Tom Jones mine." Why should it not be so said and so written? The simpler expression, the single word "mine," if used in place of "group of mines," will effect a great economy in paper and ink consumed in the mining business. And the economy should be made. It will tend to put off that evil day when the mining journals, like the smelters and the railroads, shall be forced to combine, if they would continue to live off of what the others who combine first leave of the earth.

Russian Mines for American Capital.

The very latest of alleged mining projects offered as bait for American dollars seems to be an international affair. An indefinitely vast tract of land with mines of gold, platinum and copper is the opportunity, and French and American promoters are to draw the dollars to it, or to them, by fairy tales of fabulous treasures that the Russians are too poor to pick up for themselves.

The description published of the dormant El Dorado is vague and uncertain, as is to be expected with anything possessing the Russian odor. According to these statements, the lands are in the southern Urals, traversed by the Transsiberian Railroad. The mines are undeveloped, though known to be very large and very rich. It is a concession granted by the Czar, so the promoters are reported as saying. Great hydraulic plants and enormous stamp mills and copper furnaces are to be built. The mines have been examined and reported on favorably, it is said, by American mining engineers. By somewhat of a coincidence, Senator Clark is reported as interesting himself and his money in a Russian copper mine. Quite naturally this much advertised project becomes part of the stage play of the other. A country that is good enough for Senator Clark and his millions would be quite good enough for small capitalists who have only hundreds and thousands to invest.

The preceding are of the order of fairy tales. The real business of the proposition is in the statement that it will take \$25,000,000 of capital to carry out the mining plans made for working the concession, and to carry out the similitude of reality to it all, western mining millionaires are reported as stopping in New York on their return from Paris for the purpose of being let in on the \$25,000,000 capitalization.

It is a new stage—rich mines in Russia; but the procession of brass bands and the stage properties are the same that have done service in every mining bunkoing of investors for the last quarter of a century.

Very, very little of the statement made is true. Much of it is untrue. All of it is intended to be suggestively false and intended to assist in making possible investors deceive themselves. The real facts of the particular country in which investment is asked are very different. The Transsiberian Railway in the Urals does not traverse the gold-bearing region of the Urals. There are few placer deposits in the region it does traverse. They are very poor in gold and will not pay to hydraulic. There are no platinum deposits in that section. There are no copper mines. There are a few small gold-bearing quartz ledges, and one small mill has been built and operated. The ore has been low grade and the ledges are small. The Czar has what is called in Russia the Cabinet—a body of officials corresponding to the steward of an English estate. The Cabinet may have given a mining option on some of the private estates of the Czar. If it did, it has engaged to receive 20% royalty on the gross production. The Russian laws do not admit American mining companies to operate in Russia. French companies can operate, but two-fifths of the stock must be owned in Russia and a majority of the directors must be Russians. The manager must be a Russian.

The statement made that American mining engineers have reported favorably on the proposition for American capital is probably untrue. It is doubtful if any Russian mining proposition has ever been approved by American engineers for foreign investment. No foreign mining operation has ever been commercially successful in Russia. Considering the conditions, the Russians' governmental and commercial policy with foreign mining capital, it is not surprising. What is surprising is that American investors should be expected to take mining bait that has been disgorged by French, German and English investors.

While Russia has all the vague unsatisfied interest that remoteness and lack of knowledge of it can give, it really is not necessary, if one only wants the experience of losing money in alleged mining, to make the loss to the Russians. It can be done right at home in the United States, where there is always the chance of getting it back in Wall street.

Brain Labor-Saving Devices.

On another page of this number appears a graphic table, for which our readers are indebted to D. E. Bigelow. It cost him considerable time and labor. Its publication will enable the many who will make use of it to save an aggregate of time and labor in proportion to which the time and labor Mr. Bigelow gave to prepare it will become a negligible fraction.

Engineers who have to handle the flow of water in pipes will appreciate the table. It is more generally and readily useful than a table of figures would be. Aside from the special value of the work, it should be suggestive to the reader of this journal. There is nothing so immediately useful to mining, and the engineering arts that are part of its practice, as devices that save brain labor. Very broadly, anything is a device that saves brain labor that is new to the originator of it. Graphic tables that give to the eye the results of many calculations from complicated formula are only one class of devices. Plans and descriptions of special forms of structural work in timber or metal, made to meet the requirements of conditions outside of the usual, are another class of brain labor-saving devices. Many of these forms of structure are regarded by the originators as of little importance. This, however, is a mistake. Because simple and common to them, it is not necessarily so to others. The plans and descriptions of special forms of machinery developed from use, and describing details of practice in the vast field of metallurgy, constitute another great class of brain labor-saving devices.

Each one of the vast mass of the newly originated devices represents the expenditure of brain energy. That the indefinite multiplication of this brain energy expended may be avoided is the object of publicity for what the one expenditure has already done. Knowledge is so vast an aggregate now that he who would get much of it must take it wholesale. It must be obtained and assimilated as conclusions without the scaffolding of mental construction for each new idea. Wherever possible the engineer to-day takes the result of successful work where he finds it, and applies it for his own, thankful for the saving in brain time and brain labor which the work of another has enabled him to make.

This journal, itself a brain labor-saving device for its readers, invites, as it has frequently done in past years, its readers to send to it the new ideas that their practice of the engineering arts and mining is constantly originating. In their publication each who gives will gain more than he gives. Graphic tables from formula in constant use, tables of figured engineering data, including construction costs, tests of efficiency of water wheels, drawings of constructions, details about mine and mill practice, are all exceedingly desirable and exceedingly valuable as brain labor saving.

THE ownership by the Amalgamated Copper Co. of the stocks of the Anaconda, Boston & Montana, Butte & Boston, Parrott and many other producing companies is resulting in a declaration of dividend payment of the same earning twice. This is not taken into account by the copper stock boomers, who thus overstate the dividends earned by copper to magnify unduly the importance of the industry relative to gold and silver mining. Another element that should be taken into account in the comparison is neglected, though not at all negligible. This is the production of gold and silver made by the copper mines. In current publication the profit of this production which contributes to dividends is never stated. Copper is given the credit of the dividends. As a fact, an analysis of the production of the copper mines producing gold and silver as well, and an apportionment of the cost charges between the three, will show that at least a third of the dividends credited to copper should be credited to gold and silver. If, then, there be deducted from the total of the declared dividends of copper mining companies, the Amalgamated Copper Co. dividends, and the proportion of the total that should be credited to gold and silver, the remaining dividend total paid from copper earning, while it will lead the gold and silver mining net profits for 1900, the lead will not be startling, either in aggregate or in percentage of the total profit earning of the metal mines.

Concentrates.

THE batter of the side posts in trestle bents is made about one horizontal to eight vertical.

THE seasoned wood of the blue gum (eucalyptus) has been discovered to make excellent insulating pins for electrical work.

AN average rate of driving an oil or artesian well downward to a depth of about 1000 feet, including the casing with 6-inch drive pipe, would be 30 feet daily.

THE best and latest treatise on stamp mill practice appeared in full in this paper in the issue of Dec. 1, 1900—five pages, illustrated.

IT has been estimated that with gas pipes buried but a short distance beneath the surface and exposed to a wide range of temperature the average leakage per annum per mile of 6-inch pipe is 250 M. cubic feet.

THE proportion of silver to gold in an assay bead to be parted should be as near as possible as 2½ is to 1. If necessary, add the deficiency in a weighed quantity of pure silver foil and fuse or cupel into the bead before starting to part.

INFUSORIAL EARTH is a porous, siliceous earth indurated. It is formed from the siliceous shells of diatoms and other microscopic animals, and occurs in beds that are sometimes of enormous extent. There are deposits in California and Nevada.

PUMICE is the name of the spongellike or cellular parts of lava. Its structure is believed to be due to steam or gas in the lava at the surface at the moment solidification started. The floating of pumice is due to the cellular structure, the cells containing air.

IN setting the tip of a water supply pipe to a tangential wheel, it should be so placed that the line of the jet is tangent to the wheel and the tip should be set as close as possible to the wheel without being in contact with the buckets, one-quarter inch being ample clearance.

IN sharpening drills for drilling rock the corners should be hammered thin and gradually increasing in thickness from corners to the center. If the center of bit is too thin in proportion to corners, the center cuts so fast as to cause too much strain on corners, resulting in chipping of corners or breaking of bit.

THE splash of the water from the buckets of a tangential water wheel has a velocity equal to one-half of the velocity of the jet as it impinged on the buckets. Under high heads this residual velocity even in spray represents considerable power. The shape of the bucket is, on this account, particularly important with very high heads.

EXPERIMENTS made in connection with the stone materials used in making concrete have shown limestone screenings losing 20% of fine dusty matter under washing. Tests made show that after twenty-one days the strength of briquettes made with washed ¾-inch screenings was 55% higher than that of briquettes made with the unwashed screenings.

THE work done by water from a pressure head of gravity would be done by the same water under the same pressure regardless of the source of the pressure. If a hydraulic elevator will work under a gravity pressure from 300 feet head the same machine will work with the same quantity of water delivered to it from a pump under a pressure of 130.2 pounds to the square inch.

IT would seem preferable, where practicable, to put water power into use directly by direct connecting a water wheel with each machine requiring power rather than to develop the power in one unit and transmit it to individual motors for each machine. The use of the water direct is a saving of power, and therefore of water. The plant cost is somewhat less using the individual water wheels.

WITH electric power employed in a mine and mill, many of the operations of which are intermittent uses, in order to equalize the consumption of power, it is desirable to use a motor to compress air into a relatively large air storage capacity. The compressed air would then be used for air-power drills and hoisting. The electric power would be used direct in the mill and for pumping in the mine.

THE slip in slip-jointed sheet-metal pipe should not be less than 4 inches nor more than 6 inches. To slip two joints together, wrap a piece of gunny sack saturated with kerosene around the end of the joint slipping outside and set it on fire. The heat will fire the coating outside, expand the metal and melt the coating inside, so that the other pipe end can be started in and driven by a block and maul from the other end.

THE notice posted on a claim that an owner or the owners will not be responsible for payment for work done under a lease, bond or contract, protects the interests of the owners against liens from the date of posting. It would seem also that it would protect against liability for liens created before the date of posting provided the holder of the claim does not within thirty days from the posting make demand of the owners for the claim and make the lien. Delaying more than thirty days would seem to bar the lien attaching.

FOR concrete any good hard stone may be used, granite, trap or limestone being most common, and sandstone being generally forbidden. The stone must be clean, and it is sometimes required to be screened free from stone dust, which reduces the strength. The size is

generally limited to 1½ or 2 inches in the maximum dimension, while a ¾-inch granite is preferable for bridge seats, pedestal blocks, etc. Gravel is sometimes used in concrete, either alone or as forming not more than 50% of the specified amount of stone.

THIRTY TONS of dynamite exploded in one blast, but in many separate charges, through two acres of Arch rock, an obstruction to navigation in San Francisco harbor, produced comparatively little earth-shaking effect at a distance. This was probably due to the distribution in many charges. The interference of the small earth waves coming simultaneously from many adjacent points dissipated instead of cumulating their effect. The blast was successful in removing the obstruction.

SEVERAL new discoveries of corundum in quantity have been made recently in Ontario, Canada, where the corundum occurs in a syenite, and in North Carolina and Georgia in a gneiss or a quartz schist. Except in Montana, the corundum localities in the United States are limited to the Appalachian region, and its mining has been confined to northeastern Georgia and southwestern North Carolina, except for the emery mines at Chester, Mass. Its great value as an abrasive lies in the fact that next to the diamond it is the hardest mineral known.

PROXIMATE areas of irregular boundaries can be obtained from a plat without the use of a planimeter if an assay balance sensitive to a tenth of a milligram is available, by the following method: Take thin tracing paper and with the scale of the plat line off a square or other convenient shape containing any convenient number of square units; 100 is usually convenient. Cut the square to the lines and weigh the pieces on the balance and determine the weight of one square unit. Line out, by tracing on a sheet of the same paper, the irregular area to be computed, cut to the lines, and weigh. A division of this weight by the unit area weight will give a proximate area.

THE Supreme Court of California has reversed in the Tuolumne county case of J. M. Burns vs. the owners of the Mt. Lily mine the finding of the trial court. The facts were that Burns, who was employed by the defendants grading a millsite on public land which was not claimed as a mine, discovered a pocket containing \$25,000 gold, which the owners of the Mt. Lily mine took possession of. Burns brought suit to recover the value of the gold. The trial court decided that the gold belonged to Burns' employers. The Supreme Court has reversed this decision and decided that the gold that an employee finds on public land belongs to him as discoverer and not to the employer.

THE General Land Office of the United States has always held that it was necessary to show a discovery of valuable mineral on a mining claim before it could be patented. In the oil land contests, so called, between scrippers and locators the decisions of the Commissioner and the Secretary were that the locators had a grant right of occupancy of the land that prevented lieu scrip from attaching. The decisions did not make the locations patentable without a discovery. The Land Department recognized physical conditions in its decision and refused to take away from a locator acting in good faith his right to discover the petroleum by the expenditure of his labor. But there was nothing in the decision which would permit a mere locator without discovery of the petroleum to patent the ground.

THE new California Code makes it the duty of supervisors on application of parties interested to cancel the assessments and delinquent taxes on all possessory rights which under instruction of the State Board of Equalization have been heretofore assessed and taxed. The provision is made retroactive. It affords a method of clearing up the titles to many mining claim locations. Under the laws in force before the new provision came into effect if taxes became delinquent on mining claims, even if they were abandoned, they were sold to the State. The State, however, could acquire no title to public land of the United States by virtue of a purchase at sale for delinquent taxes, and the only effect was to cloud titles, which can now be simply and inexpensively cleared.

USE a mining transit for underground surveying in preference to a compass, but be prepared to make a mine survey with any tools you have or with no tools at all. There are many mine openings in which it is impracticable to set up a transit. Under such limitations make the survey by the measurement of lines, using fine wire stretched taut between points to measure on and from. Using plumb bobs and a straight edge with a spirit level, vertical angles can be measured by measuring the three sides of the triangle made by the line of the survey, the plumb line and the base from the plumb to the foot of the survey line. Angles between survey lines can be calculated from three-side measurements of triangles, two sides of which are the survey lines or the measured portions of them.

LIGHT galvanized sheet iron, No. 26 gauge, will do for 4-inch water pipe where there is no water pressure on the pipe. It is rather too light metal to be durable. No. 22 gauge metal would be better. With No. 18 gauge metal 4-inch pipe under the conditions of no water pressure is made unnecessarily strong. Black sheet iron pipe made of No. 22 gauge, dipped, will answer as well as the galvanized. The dip preferable is composed of pure asphaltum and refined maltha. Coal tar is used as a substitute for the latter. The prepared dip can be obtained in barrels. The quantity required per foot of 4-inch pipe would be about three-quarters of a pound to a

pound. For dipping 4-inch pipe, a vessel made of sheet iron, about 30 feet long, should be made; in form, a half circle of 8-inch radius, closed at the ends. A temporary furnace can be built under one end and a flue run under it to a draft stack at the other end. The dip should be heated to between 300° and 400° F., and the section of pipe should remain in it till brought to the same temperature.

MORE important than recording a notice of location is making the location. Making the location comprises: (1) finding valuable mineral; (2) marking on the ground the boundaries of the location of the discovery; (3) posting a written notice of location with the names of the locator, the date, and a description of the claim that describes it so it can be found and identified on the ground; and (4) entering into possession and continuing that possession by every year doing the annual assessment work. Doing these things the ground is not open to relocation. Failure to record a location does not create a forfeiture. A claim may be void from the beginning because of an improper location, not properly marking boundaries or posting notice. It is only forfeit by failure to do assessment work. A legal location held twenty-five years in conformity with law cannot be forfeited because the locators failed to record the notice.

SEVERAL varieties of clays can be used for making vitrified brick, but they are not all equally desirable. Surface clays of glacial origin, semi-refractory clays and non-refractory shales can be employed. The latter are preferred, being usually fine-grained, and containing a sufficient quantity of fusible impurities to bring about vitrification at the proper temperature. An average shale analysis would be silica 56%; alumina 22.5%; ferric oxide 6.7%; lime 1.2%; magnesia 1.4%; alkalies 3.70%; and loss in ignition 7%. There is considerable range of variation in composition allowable. The shale, when ground and mixed, should be quite plastic and should possess good tensile strength. It should burn to a dense product and the points of incipient fusion and viscosity should be at least 250° F., and preferably 400° F. apart. In drying or burning, it should not shrink excessively; between 9% and 12% is about right for the maximum.

THE Hunt & Douglas copper recovery process consists in treating the roasted ores with a solution of ferrous chloride, cuprous chloride being formed and going into solution. The solution is passed over native copper and changed into cupric chloride, and finally over scrap iron which precipitates the copper and regenerates the original ferrous chloride. The copper in the ore must be roasted and fully converted into oxide, which is on a commercial scale a difficult operation. Either too much heat in roasting or too little results in loss of copper through failure to make it soluble, or by loss of iron by having it in the form of sulphate. The advantage of the method is in the small amount of iron required to precipitate the copper compared with the sulphate processes. Theoretically, the consumption of iron per ton of copper produced should be 968 pounds, as compared with about 3600. Practically it is found to require about 1500 pounds.

THE cost of production of copper at Lake Superior mines depends on the percentage of copper recoverable from the rock. The silver it contains just about pays the cost of the electrolytic refining which recovers it. The flat cost of mining and reducing a ton of copper-bearing rock will average close to \$2.50; exceptionally it has been brought down to \$1.90. With the average cost \$2.50 a ton, a yield of copper of 1%, or 20 pounds, would cost 12½ cents a pound, to which must be added 2 cents for freight, refining and selling, making the total cost 14½ cents per pound. Two per cent ore, yielding 40 pounds of copper to the ton, would cost 6½ cents a pound, plus 2 cents, 8½ cents a pound. If costs to the ton of ore are \$2.50, with copper selling in the market at 17 cents a pound, ore that yields 16½ pounds of copper to the ton—0.83%—will just pay costs. If costs to the ton of ore are \$1.90, with copper selling at 17 cents, ore that yields 12½ pounds of copper to the ton—0.63%—will just pay costs.

A DEVICE which will facilitate the collection of the figured data from which to calculate the actual rock in place removed in making a tunnel construction is made as follows: Such tunnels have rail tracks in them and advantage is taken of this. On a car truck is set up a vertical shield, say 16 inches wide and extending from a foot or so above the middle height of the tunnel. The shield should be at the extreme front end of the truck and set vertical and fast in place. Fasten a paper protractor, with degrees reading from 0 to 360, on the front side of the shield, with the zero point vertically below the center. The center of the protractor should be about middle height of the tunnel. At the center set a pivot pin, with a flat sleeve head, through which a flat graduated measuring stick slides. The length should be such that it will remain in the slide and reach extreme points in the tunnel cut. To use the device, slide out and in the measuring stick at any desired point till any angle point in the tunnel is touched. Read the degrees of the angle with the vertical from the position of the measuring stick on the paper protractor. Read the distance from the center of the angle point in the tunnel section on the measuring stick. Record the angles and distances. From this record the cross section can be plotted and its area determined. With the distances between two successive cross sections known, the cubic space from which rock is removed is determinable with a high degree of exactness.

Loss of Pressure by Friction of Water in Pipes.

Written for the MINING AND SCIENTIFIC PRESS by D. E. BIGELOW.

Part of the practice of every engineer having the planning of water pipe service lines is the calculation of pipe capacities, velocities of flow of water, sizes of pipes, and losses of pressure. It is purely mechanical work, requiring many repetitions and consuming much time. While the results of such calculations are indispensable, the getting of the results by mathematical calculation every time it is necessary to make pipe estimates has seemed wasteful of valuable brain energy. Desiring to save some of this waste, I have prepared a graphic table by calculation from the accepted formula for pipe water flow. With this graphic table the mechanical labor of calculation is eliminated entirely for pipe estimates within its figured outside limits of pipe diameter and velocity of flow.

In illustrating the use of the graphic table here-

plant consists of a horizontal compound condensing engine driving a 130-kilowatt generator. The pumps, of the three-throw mining type, with plungers 11 inches in diameter by 18 inches stroke, deliver 500 gallons per minute against a head of 600 feet. Three men can take care of the plant, which runs for only eight hours per day out of the twenty-four, and the coal consumption has been reduced to two and one-third tons per day. The total working cost now amounts approximately to \$2400 a year.

Gold Mines in Korea.

A concession covering a gold mining district has been granted by the Korean Government to a French subject, P. M. Saltarel. It is similar to those already granted to Americans, Russians, Germans, British and Japanese. It is for a period of twenty-five years from the date of commencement of operations, which must be made within two years. A royalty of 25% net will be paid to the Korean Government after the expense of development has been recovered. No im-

A Modern Pumping Plant for Leaching of Alkaline Lands.

The gasoline pumping plant illustrated is on the front page is of the direct-connected type, with a vertical three-cylinder engine, arranged to use either gasoline or distillate as fuel, and driving a centrifugal pump through a friction clutch on the crankshaft, the friction clutch being considered essential, as it admits of starting the engine without the load, which can be thrown in without undue strain.

The engine is provided with a governor of a simple type, which acts direct on the amount of fuel supplied to the cylinders, thus designed to insure economy in operation, with the simplest mechanism. The speed of this engine is 300 revolutions per minute; running at this rate, it would deliver over 8000 gallons per minute. The engine is rated at 50 H. P.; under a brake test, the manufacturers say it delivered over 73 H. P.

The purpose for which this plant is used is unusual,

FRICITION LOSS
IN PRESSURE OF WATER FLOWING THROUGH 100 FEET OF PIPE OF VARIOUS SIZES
AT DIFFERENT VELOCITIES IN FEET PER SECOND GIVING DISCHARGE IN CUBIC FEET PER MINUTE
FROM WEISBACH'S FORMULA
BY D. E. BIGELOW.

with presented, suppose it is required to pipe 100 cubic feet of water per minute at a velocity of flow not to exceed 4 feet per second. Wanted to know the size of the pipe required and the loss of pressure in each 100 feet of pipe.

Read up on the vertical line denoting 100 cubic feet per minute to the curved line representing 4 feet per second. Just below the intersection the line denoting 9-inch pipe crosses the 100-foot line, showing that 9-inch pipe will be required. The horizontal line intersecting at this point is .30, showing there will be a loss of .30 pound per square inch in pressure for each 100 feet of pipe.

Of the four denominations represented in the table—velocity, quantity, size of pipe, and loss of pressure—any two being given, the other two may be determined in the same manner.

An Electric Pumping Plant in Scotland.

An elaborate electric pumping plant has lately been introduced in a Scotch coal mine and the figures representing comparative costs of the new system and system pumping are very interesting. In the original pumps, working against a head of 581 feet, there were three lifts, a duplex pump working 160 feet, another duplex pump working 311 feet and a bucket pump working 110 feet. These required seven men for attendance in working and consumed fourteen tons of coal per day of twenty-four hours. The plant ran seven days a week and the annual total cost of pumping, without allowing for maintenance, etc., was approximately \$20,000. The new

port tax on necessary materials will be levied, and the products of the mine will be exported free of duty. Other minerals besides gold may be mined within the district. The district has not yet been located, but it cannot include any of the forty-three districts reserved for the Crown and known as the Household mines. The district must not exceed in extent 40x60 li (13½ to 20 miles).

Gold mining in Korea has been successfully prosecuted by the Oriental Con. M. Co., an American organization, which operates the Woosan mines. This company has a district some 25 by 30 miles in extent. The company disposed of the 25% royalty by paying a large sum in cash and agreeing to pay a fixed annual amount. It is now successfully operating two mills of twenty stamps each and one of forty stamps, while another 40-stamp mill is in process of erection. The company have a cyanide plant as well. The operations at present are confined to quartz, but placer deposits will soon be worked. Some seventy foreigners are employed at these mines, with over 3000 natives. The natives are said to be satisfactory as miners, and they are content on a wage of 20 cents gold per day.

The British mines are at present next in importance to the American mines. They lie not very far from the district occupied by the Americans. Much money is being expended in exploitation, but they are too new to be out of the development period.

The Germans are actively engaged in working their district, which lies to the east of Seoul. The Japanese are opening up their mining district to the south of the city. The Russians seem not to have begun work upon their mining concessions as yet.

and a striking evidence of the importance of scientific methods in dealing with the problems arising in large farming operations, particularly where marsh or alkaline lands are to be reclaimed. In the present instance what is contemplated is a huge leaching operation, by which the injurious alkaline salts are leached out by the rains, carried through an extensive and scientific system of tile drains to the pumping plant, raised about 12 feet, and flumed across the low sand hills to the ocean. Thousands of acres of land are underlaid by this system of tile drains, and the natural waters, distributed over the surface in the form of rain, percolate through the alkaline land, taking up the salts in solution, and being finally delivered to the pump.

The enormous amount of alkaline salts that may be removed by this process may be appreciated when it is considered that the capacity of the pump is stated to be over 8000 gallons per minute, and the amount of alkaline salts in the water is sometimes over 6%.

This pumping plant was furnished by John Wigmore & Sons Co. of Los Angeles, Cal., to the Patterson Ranch Co. at Oxnard, Cal., for use in connection with the drainage system of their extensive sugar beet, lima bean and other lands in that neighborhood, and is reported to have been in successful operation for some time. The entire installation is one of unusual compactness, and considered peculiarly suited to the requirements of the case, as the duty at some seasons may be intermittent.

The success of this installation may lead to others for the same purpose, as the importance of this method for removing the objectionable salts from alkaline lands gives promise of success.

The West Gore Antimony Deposits, Nova Scotia.*

From 1840 (the year of discovery) to 1892 the mine was worked with varying success and under a number of various managements until 1899, when it was closed down, and remained so until the present owner, Alex. McNeil, bought the property about two years ago, and since then considerable prospecting work has been done. About 1100 feet from the McDougal discovery, in a southwesterly direction, another vein of this same ore was found by Gould Northup in 1887. The north and south veins, as they have been called, each have the same course, dip and general characteristics; but, as it was from the north vein that the large proportion of ore was obtained, the writer will confine himself almost entirely to it in this description.

The north vein is a true fissure vein; it has a course N. 45° W. and a dip to the S.W. averaging 85° from the horizontal, and has been traced upon the surface for over 1200 feet. The jumbled up slate, calcite and quartz which constitute the vein filling is cut by numbers of small quartz stringers from the foot wall side. This foot wall is irregular and indistinct, but the hanging wall is always clear cut and smooth. The country rock is made up of gray slates and quartzite, which have a strike almost east and west, and a dip of 45° from the horizontal, towards the south, and no faulting has occurred since the vein was formed.

The ore, as a rule, clings closely to the hanging wall, but in one or two places it splits in two and one part follows the hanging wall and the other the foot wall, while at times it will break entirely away from either and follow the center of the vein.

The ore is stibnite, solid sometimes, and then again is mixed with quartz. Where the stibnite has been exposed it has oxidized into the orange-colored kermesite and the white valentinite; but these oxides are in very small quantity and only as a thin coating over the solid ore. Sometimes the stibnite is replaced by iron pyrites, arsenical iron pyrites and galena. More or less gold is always found in the ore, and seems as a rule to be richest in that metal when the percentage of stibnite is high. With the excep-

tion of where a cross vein of quartz comes into the vein at No. 1 shaft, none of the gold is free, even in ore assaying as high as ten ounces gold to the ton. The width of the vein has varied in size from a few inches to 7 feet, and in its widest place has been solid stibnite. The ore chute has an average dip of 45° to the southeast.

From the section plan, it will be seen that a number of shafts have been sunk on the vein, but the one now called No. 3 was the first deep shaft put down (the outcrop was a little to the west of this), and reached to a depth of 170 feet. No. 2 shaft, 220 feet to the eastward, was sunk to a depth of 170 feet, but has since been extended another 70 feet. No. 1 shaft, vertical for 240 feet, with its crosscut to the vein and crooked winze shaft of 188 feet, was the last sunk and is situated 156 feet east of No. 2 shaft; besides these, four shafts from 20 feet to 40 feet deep have been sunk on the vein east of No. 1, and two more west of No. 3 shaft; in these, except in No. 4 shaft, the ore was very low grade, but they demonstrate the great extent and continuity of the vein.

The amount of ground stoped is estimated roughly at 76,000 square feet of the vein, and this no doubt is the outside limit, for no account is taken of a little low-grade ore which is left in the stopes as pillars and in other places, for the writer is informed that only ore carrying 50% of antimony and over was marketable. Of course, some of the second class ore was sorted up to the standard. From the above amount of ground stoped there has been shipped, according to the export returns of the Customs Department, 3121 tons, and since the present owner secured the property they have shipped 1236 tons of second class ore from the dump—550 tons of this were sold to the Antimony Gold & Complex Ores Ex. Co., and gave 12% antimony and 18 dwt. in gold—686 tons were bought by the St. Helen's Metal Recovery Co., and gave 11.83% of antimony.

From the many assays made of the high-grade ore, it is safe to say that 3000 tons shipped previous to 1892 averaged between two and three ounces of gold per ton. For a long time it was not known that the ore contained any gold, and when it was discovered the smelters refused to give any value for it. The greater demand for antimony ore has increased the price, and the improved metallurgical processes have not only made possible the utilization of a much lower-grade ore, but have enabled the smelters to pay for a considerable proportion of the gold.

The St. Helen's Metal Recovery Co., after putting up a trial plant and proving it successful, are erecting works to treat 600 tons a month, and will not only buy ore as low as 12% antimony at regular market prices, but expect to be able to pay 75% of the gold contents. There are several thousand tons of this second-class ore in the mine to-day not stoped, besides larger quantities are said to be lying in the chutes, which, at the time operations were carried on, it did not pay to hoist to the surface. An estimate of the second-class ore left in the vein will give it an average thickness of six inches—containing 12% antimony and \$23 in gold to the ton of 2240 pounds.

According to the miners who worked in the mines during the whole period of operations, the ore stoped averaged 1 foot in thickness, and this coincides with the writer's calculations. This stoped ground is the high-grade ore chute, and it is practically worked out down to the bottom of No. 1 shaft.

Samples taken of the slate and soft vein material,

Comparison of Fire with Water for Concentration.

Written for the MINING AND SCIENTIFIC PRESS by S. E. BRKERTON

Since the introduction of large, rectangular furnaces with improved power plants, a more steady ore supply and more attention has been paid to the scientific branch of the metallurgy of copper smelting, the so called "fire process" is driving the wet concentration process to handle only extremely siliceous ores low in values.

The advantages of concentration by the wet process are; getting rid of the silica, which generally requires the addition of lime and iron in the blast furnace when smelted; the production of concentrates containing an excess base; the obtaining of the values originally contained in several tons of ore in one ton; and the saving in freight to the smelter and cost of treatment. To offset these advantages are the losses in copper, silver and gold in the tailings and slimes, losses of copper in solution, and the fact that concentrates are not suitable for smelting until either briquetted or fused in a reverberatory furnace. This last disadvantage is generally more than offset by the iron the concentrates contain in excess of the silica, where silica is in excess in the average ores to be smelted. The losses in concentration vary greatly, depending somewhat on the skill of the mill men in charge, but more often on the character of the ore being treated. The losses are greater when the ore contains the higher grade copper minerals rather than native copper or chalcopryite. When the copper is oxidized, wet concentration is practically out of the question. Very often the character of the ore in the same mine is different in the different ore shoots.

I do not claim to be a practical mill man myself; yet, some twenty years ago, while acting as assayer and chemist in charge of the assay department of the old La Plata smelter at Leadville, Colo., parties would bring me ore to be assayed, and, after learning its value, express their intention of securing a concentrating plant, which I would often try to discourage, especially if the ore contained much of its values in gray copper. In several cases they had their original ideas carried out, mill men were condemned, and changed, one after the other, and finally the mills were shut down, to remain idle or to be removed. At that time—eighteen to twenty-one years ago—copper was not generally appreciated, as now, as a collective agent for gold and silver values; so that if the ore could not be concentrated and was too low in values to stand shipment to a smelter, there was no salvation for the property but to remain idle. Take the same property to-day, and assume that the ore contains:

2% wet copper, @ \$2.50 a unit, equal to 12½c. B. D. \$5 00
10 ounces in silver, less 5% in smelting, net value.. 6 00
1½% of an ounce in gold, value..... 1 00

Total value.....\$12 00

Start with this \$12 a ton gross value, concentrating by fire, say:

10 tons into 1, producing 20 tons of matte,
@ \$120 per ton, produces (smelting 200
tons ore net in 24 hours).....\$2,400 00
Less cost of smelting, @ \$2 per ton.....\$400 00
Cost of marketing 20 tons of matte at
\$15, equals.....300 00 700 00

Leaves a balance of.....\$1,700 00

a day to pay for mining, and profits, as against \$230 by wet concentration, as shown in the following figures:

With wet concentration, 2% copper has generally meant little or no values when concentrated, as it is nearly all lost.

10 ounces of silver, say, 60% saved, value about...\$3 60
1½% of an ounce in gold, say, 80% saved, value about. 80

Total.....\$4 40

Put four tons into one by concentration, and we have \$17.60 gross value in concentrates.

50 tons of concentrates made from a 200-ton plant equals.....\$880 00
Less cost of milling at, say, 75c. per ton...\$150 00
Cost to market 50 tons of concentrates, at about \$10 per ton.....500 00 650 00

Leaves a balance of only.....\$230 00

to pay for mining the 200 tons, and the expected profit.

The same comparison holds good even on a smaller output; but, of course, the cost of smelting would be greater in proportion with a smaller plant, on account of certain fixed charges, and the same increase would hold good to some extent with a concentrating plant. When the ore is very siliceous, say, over 70% silica, if lime and iron is expensive, especially if the ore contains less than 1% copper, then it may be better to concentrate the most siliceous and poorest ore mined in order to produce a concentrate containing an excess of iron to flux the richer and generally less siliceous ore.

This comparison between wet and fire concentra-

care being taken that no ore would get into the sample, assayed as follows:

| Number. | % of Sb. | Gold Values. |
|----------|----------|--------------|
| 3 | 0.20 | \$0 50 |
| 8 | Trace | 2 00 |
| 9 | Trace | 0 50 |
| 11 | 1.76 | 2 80 |
| 17 | 0.15 | Nil |
| 21 | Trace | Trace |

Gold values estimated at 2000 pounds = 1 ton.

Assays of high-grade ore from the south vein gave 60.29% antimony and 2.66 ounces gold per ton of 2000 pounds, and a second-class ore 5.27% antimony and 1.38 ounces gold per ton of 2000 pounds. Five tons of ore assaying 56.96% antimony and five tons assaying 12% antimony were shipped from this vein to the St. Helen's Metal Recovery Co. A shaft has been sunk on the south vein 105 feet.

Another vein of stibnite ore was found by John McDougal a couple of years ago about 700 feet northeast of his original find. There has been found at times rich float ore on a hill situated between the north and south veins, and which it does not seem possible could have come from either of these veins.

* W. R. Askwith, in Canadian Mining Review.

tion is not intended for argentiferous lead ores, especially when the lead contains most of the silver, nor is it intended to apply to a smelting with cold blast, managed with no more metallurgical knowledge than is usually required to manage a wet concentrating plant.

It may be claimed by some critics that smelting cannot be done for \$2 per ton with a 200-ton furnace, and that there will be additional cost of roasting necessary.

In my estimate of the value of copper, I have figured copper at only 12½ cents per pound, allowing the difference between that and the present market quotations, for refining charges, commissions, etc., and it is about the value of copper in matte containing 45% to 50%, which can be made where siliceous ore can be obtained, and a much higher grade matte can be made by resmelting, the cost of resmelting the matte being more than offset by the saving on freight and treatment by the reduced weight of the matte. I have also allowed \$15 per ton on the matte for the freight. Roasting is unnecessary and out of the question for the production of matte when hot blast is used, and a 200-ton plant at \$2 per ton would mean \$400 per day for expenses, to be divided about as follows:

| | |
|-------------------------------------------------|----------|
| Labor..... | \$158 00 |
| Boiler and miscellaneous fuel..... | 42 00 |
| Coke, say..... | 100 00 |
| Lime rock..... | 40 00 |
| Total..... | \$340 00 |
| Add 10% for supplies, lights, repairs, etc..... | 34 00 |
| And for bricklaying and smelting flue dust..... | 26 00 |
| Total..... | \$400 00 |

The above amount does not include insurance, taxes, interest and the salaries of president, manager and superintendent.

This cost can be reduced still more by increasing the tonnage, as the fixed charges, such as office expenses, foremen, engineers and carpenters, would remain the same. On the other hand, the fixed charges would remain nearly the same, even if only 100 tons of ore per day were being smelted, which would make the cost of smelting with a small-capacity smelting plant proportionately greater on that account.

The Scooby Tailings Sampler.

The accompanying illustrations show a new form of a tailings sampling machine that has been in operation in one of the Denver ore-testing plants for some six months. The machine under trial is reported to have given very satisfactory results, and it is now

intermediate proportionment may be taken, as desired, by regulating the arc of travel of the bucket and the number of strokes per minute. In the average 100-ton stamp mill the flow of crushed ore and water will amount to about 300 gallons per minute, or 150,000 gallons per eight-hour shift. The Scooby sampler, adjusted to take a sample every five minutes, will gather about fifteen gallons of wet sample or about one gallon of dried sample in this time. The accuracy of the machine on these small samples is considered very good, as the cut is taken across the entire stream at practically uniform speed and at regular intervals. It has been recognized that the ordinary system of taking tailings samples in mills is not wholly satisfactory, dependent as it is on the attention of the mill man as to detail. The only correct method of sampling tailings is the same as is used on the heading for concentrates, namely, taking samples at regular time intervals, and cutting entirely across the stream, as is done by the above illustrated machine.

The Scooby sampler cuts through the entire stream, but so quickly that only a small proportion is diverted. This feature is obtained in the Scooby sampler by a small mechanism that passes the bucket through the entire stream of pulp in about one-half second of time, and locks the bucket arm in position entirely out of the stream until time for the return stroke. The bucket is held outside of the stroke in periods that may be varied from one to five minutes, when it is automatically unlocked and returned through the stream. The bucket is only supposed to work on the pulp for a small fraction of time. The mechanism is protected by an iron case. It is arranged to be either set upon a separate arm, or to be belted underneath, and attached to the launder itself, in such a manner that the bucket passes by the end of the launder and deflects a small portion of the stream into a sample box. Very little power is required to operate the sampler, and, if a line shaft is not convenient, a small water wheel in the launder itself will furnish sufficient power to drive the machine. The illustrations show the machine as placed for operation on a discharge pipe from a concentrating works, and also a view showing the interior arrangement of the machine.

A Modern Submarine Drill Boat.

The illustration on the front page is of the drill boat G. A. Howells, recently built by H. T. Dunbar & Co. Submarine rock excavation is difficult and expensive work. Experience and close contact with the difficulties involved are essential to success in work of this kind, and this boat in its simplicity of

moving submerged obstructions from navigable waters; also for the obtaining of data relative to the composition of the bottom under water preliminary to engineering constructions, such as bridge piers or tunnel bores, the drill boat is exceedingly useful and efficient. In a recently promoted project to connect England and Ireland with a tunnel under 35 miles of sea bed, a proposition was made by a responsible firm to drill the bottom in the line of the tunnel to depths of 600 feet and through water of equal depth. The illustration used is by courtesy of Compressed Air.

Mines of Northwestern Montana.

[STAFF CORRESPONDENCE.]

Going eastward from Spokane over the Great Northern takes the traveler through a well watered, heavily timbered, mountainous, but not rugged, section of country, extending from Spokane to the Flat-head valley, a distance of 250 miles. The route passes along Pend d'Oreille river for some distance, the latter being the outlet of Pend d'Oreille lake, which is the largest body of water in Montana, and belongs to the Columbia river system. About 100 miles east of Spokane is Bonner's Ferry, on the Kootenai river, which from that point flows northward into Kootenai lake, forming an arm of the Columbia headwaters. A branch railroad line runs from Bonner's Ferry northward, down the Kootenai to Kuskonook, in proximity to the Kootenai silver-lead district. Boats also run between Bonner's Ferry on this stream and Kootenai lake.

Continuing eastward on the Great Northern main line we arrive at Libby, Mont., where Libby creek empties into the Kootenai. This point is of interest because it is the supply and shipping station for the mines in the Cabinet range, which lies to the south some 30 to 40 miles. This range trends from the northwest to the southeast, and is drained by the Pend d'Oreille streams on the south and the Kootenai affluents on the north. The principal streams which flow from this range toward the Kootenai are Libby creek and Fisher river. The basins, gulches and mountain sides drained by Libby creek mark the location of such silver-lead properties as the Snowshoe, Silver Cable and Great Northern, where large expenditures have been made on mills, roads, tramways and underground work. Farther southeastward, in the gulches, basins and hillsides that drain into Fisher river is what is called Fisher district, where the ores are gold-bearing and free milling to a rather marked degree, with sufficient amount of iron and lead sulphides to make concentration of the plate tailings a satisfactory feature. Coarse flakes and particles of gold are visible in much of the white and decomposed quartz that is brought from this district.

Better to illustrate the characteristics of the Fisher district, I give below a few notes on the various groups under development:

The Way Up, on Ibex peak, belongs to Butte parties and is in charge of J. H. Riley, who states that their work aggregates 600 feet of tunnel and cross-cut, and that there are about 4000 tons of ore blocked out, which shows good values in free state and in sulphides. It would run about \$12 per ton. A second tunnel is being driven to cut the lead 150 feet below present workings. The tunnels drift on the ledge.

A. B. Johnston has organized a company to develop and equip a group in the same district. A stamp mill is contemplated.

The North Star group of six claims belongs to D. L. McGillis and J. C. Burgoyne, who have about 200 feet of development work done on two parallel ledges that follow the general trend of the mountain range. The ore characteristics disclosed are the same as those of adjacent properties herein described.

The Blacktail group, of which Scott N. Sanford of Kalispell is manager, is owned by a company of Montana and Idaho people. The property embraces nine claims and a water right. The work, which aggregates about 1000 feet along the strike of the veins, discloses a siliceous ore, with a small per cent of sulphide of iron and lead, the principal values being gold. A 10-stamp mill is being erected to save the gold by amalgamation and concentration. It is expected to be operating in a few months.

The American Kootenai group, also in the Fisher district, covers two parallel ledges, 500 feet apart, with over 200 feet of drifting on each one. The veins vary in width from 2 to 4 feet, the ores carrying free gold in hard and decomposed quartz, with a small amount of iron sulphide. A 10-stamp mill, with plates and concentrators, is operating on about twenty-five tons of ore daily. Manager W. J. Beager states that 90% of the saving is effected by amalgamation.

The Mother Lode group, in the same locality, is also under Mr. Beager's management and belongs to virtually the same stockholders, A. Whitworth being president of both companies. A flume is being built so as to utilize 200 pressure of water for power. A tramway 3800 feet long is to be built from the Mother Lode mine to the mill. This property has four parallel ledges that follow the formation, and a fissure that crosscuts it, there being unusually high grade ore

The Scooby Tailings Sampler.

being placed in some concentrating mills by the Mine & Smelter Supply Co. of Denver, Colo., agents for the sale of the machine.

The manufacturers claim as valuable features of the machine: Its ability to gather a very small sample from a large flow of pulp, its compactness and its extreme simplicity. It can be adjusted to take from 100 to 1000 part of the tailings stream, and, if required, may be made to operate from 50 to 2000. This range of adjustment is governed so that any in-

construction, rigidity and in the details, especially of the drill mountings, should be capable of efficient work. This system of drilling is peculiarly applicable to large ledges of rock. Three Rand drills are mounted on light but rigid frames and are capable of drilling holes of from 12 to 15 feet in depth without change of bit. The machines are not fixed to the edge of the scow, but can be moved horizontally as well as vertically.

The use of these drill boats is very largely in re-

at the point of intersection. The walls here, as elsewhere in the district, are both slate. But in many cases the ore shoots follow a dike of porphyry or lime. There is some tunnel and open cut work on the Mother Lode.

The Fisher Creek M. Co. now own the group formerly operated by Brick & Brannegan, who are among the stockholders of the present company. The property is on the same belt as that of American Kootenai. It is opened through two tunnels. A 10-stamp mill, operating on twenty-five tons of ore per day, is being enlarged to twenty stamps. Water power is being put in. The ores run about \$10 per ton.

P. E. Bergstrom & Bro. own a claim on the same belt, on which they have uncovered the ore on two ledges by tunnels, open cuts and stripping. The ore disclosed carries many unusual specimens of free coarse gold in the characteristic quartz of the district.

C. N. Downing owns the Fourth of July group, with water right, whereon there is considerable amount of development, which has resulted in a good showing ore so far as work has gone.

There are other groups in this district, but the above show its general features. There is not much activity among the silver-lead mines near the head of Libby creek.

The Snowshoe is said to be pretty well developed, having good ore bodies with fair values, and that a large tonnage of ore is blocked out. The property includes a concentrator and tramway and belongs to the Pacific Northwest Mining Corporation of London.

The Silver Cable, 6 miles south of the Snowshoe, on the same belt, is also fairly developed and has a concentrating mill and tramway line. It belongs to minor heirs.

The Great Northern group, near the head of Libby creek, belongs to Hildebrand, Allen & Williams of Libby, and has a good showing of silver-lead ore.

On the lower course of Libby creek are some placer operations which are profitable. B. F. Howard has 1000 feet of pipe line, giving 216 feet pressure on two giants that are at work. Mr. Howard has given an option on his group to Butte parties. He says some of his ground ran as high as 75 cents per cubic yard.

Vaughn & Green are also operating on their placer ground on the same creek. Mr. Vaughn showed the writer about \$300 worth of coarse gold, which he said resulted from thirty-five days' work with small facilities.

Wm. Criterman is putting in a flume for hydraulic work on his placer ground on the same creek.

The Thomas group, 6 miles northeast of Libby, is a copper proposition on Rainy creek. It embraces sixteen claims, with development work that is said to show a fair grade of copper ore. The veins are said to be from 3 to 20 feet wide.

C. R. Greeley has three claims on Poorman's creek, near Libby. It is developed by two tunnels that go in on the ledge. He gets an ore that runs well in gold, silver and lead.

It is estimated that 100 men are at work in the Libby district, with the probability that this force may be increased.

At Jennings, a few miles east of Libby, a Great Northern branch line is being built northward, up the Kootenai river, to tap the Crow's Nest coal mines. The main line strikes the open country in Flathead valley, in which the principal town is Kalispell. The main range of the Rocky mountains is crossed between Kalispell and Blackfoot.

Libby, Mont., Aug. 5.

Mining and Metallurgical Patents.

Patents Issued August 13, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

PROCESS OF DESULPHURIZING ORES.—No. 680,313; L. P. Burrows, Washington, D. C.

Process of desulphurizing ores, taking high-pressure steam, permitting a jet of it to expand in a

chamber, drawing off condensed water from chamber, passing lower pressure steam drawn from chamber through a pipe subjected to external heat, applying heat to a retort containing a body of sulphide ore and passing resultant gaseous product from pipe through mass of ore.

ORE CRUSHER.—No. 680,401; C. Suttie, Onehunga, New Zealand.

A cylindrical crushing chamber provided with an inlet in its periphery, sieves located in ends of chamber to the side of its axis, a shaft loosely journaled in ends of chamber and having a vertical movement, a drive crusher roll fixed to shaft, and series of rolls loosely mounted within chamber between interior wall and periphery of drive roll, aggregate diameter of rolls being less than circumference of drive roll.

APPARATUS FOR INDICATING THE LEVEL OF CHARGES IN FURNACES.—No. 680,490; T. H. Martin, Cleveland, Ohio.

A furnace, a pair of electric terminals in interior thereof, an electric circuit leading from terminals and including a source of current, and a signal being arranged so that circuit is closed by conductive charge in furnace, bridging from one end of terminals to other.

SAMPLING APPARATUS.—No. 680,526; H. E. T. Haultain, Salmo, Canada.

Two sets of inclined spaced sampling troughs in combination with a mixing board located between sets and adapted to receive material passing between sampling troughs of upper set and discharge it upon lower set near upper ends; a discharge trough located below lower ends of each set of sampling troughs, both discharge troughs adapted to empty at same side of apparatus.

CAP—CRIMPING TOOL.—No. 680,643; H. Cogeen, Goldfield, Colo.

A knife handle provided in its opposite sections with grooves to receive cap and having within blade recess a separate seat plate secured to inner face of one handle section and provided with a notch registering with cap grooves in handle sections, seat plate

projecting at grooved portion beyond grooves of handle sections and crimping blade secured in handle and arranged to be adjusted in close relation to seat plate and having in edge notch arranged when blade is partially closed to complete with notch in seat plate approximately a circle to fit around cap.

ORE ROASTING AND DESULPHURIZING FURNACE.—No. 680,613; A. S. Partridge, St. Louis, Mo.

The furnace walls, a revoluble retort, retort-supporting flanges projecting inwardly from walls of furnace, annular wings surrounding retort and positioned within flanges, packing rings between flanges and wings, a discharge pipe leading from wall of furnace at discharge end of retort, and a chute providing a slideaway from discharge end of retort to spout.

CRUSHING OR PULVERIZING MACHINE.—No. 680,650; C. F. Delfos, Pretoria, South African Republic.

Two drums, each consisting of a ring having opening and circular end plates fitted against rings, tie bolts passing through end plates and rings of both drums to thereby rigidly unite them, a second series of bolts passing through end plates and ring of each drum, a plurality of segments in drum bearing against inner surfaces of rings, having undulatory working surfaces, wedges fitted against segments and secured to rings, a shaft extending centrally through plates, radial arms in drums, on ends of shaft, detachable hammer heads secured to arms, a driving member on shaft between drums, a hopper between drums and located over driving member.

CONCENTRATOR.—No. 680,678; G. W. Thornburgh, Denver, Colo.

A suitable frame, and rollers journaled thereon, an endless traveling apron mounted on rollers and provided with broken riffles formed by passing a device, of the construction described, back and forth through apron, its concentrating surface being longitudinally inclined, means for adjusting frame to regulate inclination of apron, a water tank underneath apron, through which latter passes, and in which concentrates are deposited, a stand pipe for supplying water to machine, and two perforated branch pipes leading from and extending above and below the apron.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

It is said the Treadwell mines will, before January 1st next, have 4,000,000 tons of gold-bearing ore blocked out and standing as a reserve.

A 3-foot lead of ore averaging \$100 per ton is reported to have been developed at the Mellen mine, at Berner's Bay. The Mellen is equipped with a 20-stamp mill, air compressor and other machinery.

KETCHIKAN.

C. Jansen, who has been prospecting on Prince of Wales in the interest of G. McKenzie of Ketchikan, has made a discovery near the head of Skowl Arm of two parallel veins or ledges, in the contact between diorite and quartzite, each of them from 12 to 16 feet in width, and separated from each other by about 4 feet of magnetic iron. These ledges can be traced by outcrop for 4500 feet. The ore is pyrrhotite, carrying both copper and nickel, assays of average samples taken from the surface giving values of \$4.50 per ton in nickel, and 4½% copper.

G. Butler, M. Christian and others of Ketchikan have developed some ledges on Coronation island, and have made a trial shipment of sixteen tons, which sampled \$88 per ton in silver and lead. They have now about 400 tons mined and ready for shipment.

It is reported that S. I. Silverman of Spokane has taken an option on a two-thirds interest in the Copper Mountain mine at a very large figure. The mine, including eighteen claims, is now making regular shipments.

KOYUKUK.

The first detailed news received since last winter from the Koyukuk diggings is to the effect that there are 300 men there and half a dozen creeks are turning out well, one property paying \$1000 a day. No one should go there without an outfit calculated to last a year, as food is scarce and transportation difficult.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence).—The Pride of the West, in Washington Camp, which is largely in control of Messrs. Smith, Wilfley & Gee of Denver, Colo., has been enlarged by the addition thereto of the Poole group, which comprises twelve to fifteen claims, adjoining the Pride of the West on the northwest. The newly acquired ground is considerably developed and is said to have 40,000 tons of ore in sight. The Pride of the West plant is to be more than doubled in capacity. It comprises hoisting plant, concentrating mill and smelter. The mill employs the magnetic method of ore separation.

Washington, Aug. 14.

GILA COUNTY.

G. P. Andrews, manager Pinal C. Co. at Globe, states that sinking has been resumed in the Black Copper shaft from the 100-foot level, and that the shaft will be continued down to the depth of 200 feet before another level is opened. A strike of ore has been made in the south crosscut 100-foot level, being 5 feet in width and going 16½ in copper.

R. Fleming, manager Black Warrior C. Co., Amalgamated, states that grading has been begun for the acid works to be erected at Black Warrior.

PINAL COUNTY.

A. R. Renzie, superintendent of the Plata Cobre Co., near Florence, says the company will do extensive development work on its property and by fall expects to have a copper matte smelter in operation.

SANTA CRUZ COUNTY.

The Santa Cruz M. Co. has six claims near Patagonia upon which development is being pushed. The ledge runs from 5% to 8% in copper, with a pay streak 18 inches in width. A double-compartment permanent working shaft has now reached a depth of 70 feet, and will be continued until a depth of 200 feet is reached.

YAVAPAI COUNTY.

It has been announced that the Decatur C. M. Co. would on September 1st resume development work on its group of claims south of Jerome.

A strike of copper ore has been made in the Walker-Larrimore group, near Jerome. The ore averages 15% copper. The claims are under bond to Hooker & McFarland and J. Loosely.

The Standard S. & R. Co., through Douglass, Lacey & Co., its agents, has contracted for the erection of a large concentration plant adjoining the Val Verde smelter on the Agua Fria. It is

expected to have it completed and ready to start up in October. The plant, in addition to working the ores from the mines now being operated under L. D. Phillips, manager, will reduce custom ores.

The Rambler C. M. Co., owning seven claims in the Agua Fria mining district, near Mayer, claims to be taking out rich copper ores. H. Reifsnnyder is president and M. D. Johnson secretary of the company, which has its head office in Los Angeles, Cal.

CALIFORNIA.

State Mineralogist L. E. Aubrey reports that his field assistants have very nearly completed the reconnaissance of the copper deposits. The area of the State which is more or less copper-bearing is found to be very much more extensive than has been supposed. Three other field investigations are to be undertaken shortly. The quicksilver deposits are to be investigated and a bulletin published. The owners of new discoveries are asked to communicate with the State Mineralogist so that they shall receive attention along with the well-known older mines. The borax deposits of Death valley in Inyo county and saline deposits generally in the southern part of the State are to be investigated and a bulletin published. Finally completing the field work for this year, so far as announced, there will be a survey of the gold-dredging operations and a bulletin issued on that industry. Data is being collected for a bulletin on the fuel value of California petroleum. The announcement is made that the mining employment department will be opened at the State Mining Bureau in San Francisco about Sept. 1. It will not be maintained as a general labor bureau, but for the purpose of supplying experienced, skilled and special mining labor. There will be no charges. Miners and mill workmen desiring employment are requested to register at the bureau and mine operators are solicited to make their labor wants known to the bureau.

ALPINE COUNTY.

The Alameda G. M. Co. has been incorporated to operate the Bowlder Hill mine, near Gardnerville. The incorporators are G. L. Loope and G. H. Strong of Bessemer, Michigan, and W. Pickerslein of Oakland, Cal. The principal place of business will be in Reno, Nev.

AMADOR COUNTY.

The east shaft of the Kennedy mine is down about 2400 feet and is being continued. A second tank for fuel oil is being built which, with the tank now in use, will hold a four months' supply. Quartz is being taken out to keep the 40-stamp mill running.

At the George Upton mine, near Plymouth, drifting on the ledge continues, and the face is now 300 feet in. The ledge so far has prospected milling ore. On the south side of the hill samples from the ledge run up to \$14 to the ton. The Pennsylvania owners have taken up twelve claims on property adjoining the mine.

BUTTE COUNTY.

It is said that the Henderson mine, situated near Wyandotte, is soon to be equipped with a quartz mill.

Work has been started at the De Long mine on the North Fork of Feather river above Yankee Hill.

CALAVERAS COUNTY.

The Melones Co. have one gang of men working on the mill at Robinson's Ferry and another putting in a log dam on the Stanislaus river, 4 miles above the Ferry. At Angels the Angels Quartz M. Co. is now crosscutting at the 700 level and the mill is crushing ore from the 500 level. T. Fullen is Supt. A two-ton car is used to carry the ore to the mill. The power used is electricity.

MARIPOSA COUNTY.

About 1000 tons of ore are being hauled from Hunter's Valley copper mine to Merced for shipment. It is thirty years since this mine was worked previous to the present operation. The ore is high grade and carries considerable gold. There are seventeen men employed at the mine. The company expects to erect a smelter in the fall.

MONO COUNTY.

P. Somerville and F. M. Skelton are operating a 6-ton cyanide plant at Pine City, near Mammoth, on 1500 tons of tailings from D. C. Albright's arrastra.

NEVADA COUNTY.

The annual meeting of the Jenny Lind M. Co. has been held at Grass Valley and W. M. Treloar, C. Stocks, O. H. Root, J. H. Oliver, E. K. Smart, J. W. Brown, of Grass Valley and J. Bernhard of San Francisco were elected directors. W. M. Treloar was elected president, C. Stocks superintendent, A. Powell secretary, Nevada County Bank treasurer.

W. H. Bray, who is operating the Posey mine near Nevada City under a bond, has

let a contract for running a 250-foot tunnel to tap the ledge at a point which will give about 150 feet of "backs."

The Ford and Mullen claims, between the Massachusetts Hill and North Star mines at Grass Valley, are to be reopened. A new shaft is to be sunk on the Vulcan. Senator Clark of Montana and others some time ago bonded the property on which the Vulcan stands from M. Ford. F. R. Hinds, representing the bonders, has made arrangements for the building of a 60-foot gallows frame and the doing of other work, indicating an intention to do deep mining.

The Texas M. Co. has let a contract to build the flume from Scotts Flat to the Texas mine, near Nevada City.

PLACER COUNTY.

W. H. Niemeyer and G. W. Manwell of Wheatland, Yuba Co., who are interested in the Zelma Bell Dredger M. Co., owning claims on the Middle Fork of the American river above Auburn, state that the company proposes to build a dredger to work the claims.

The Rocky Bar M. Co. is operating in the American river at Colfax. D. P. Hocking of Oakland and G. W. Crystal and J. Burns of Vacaville are interested in the company.

The ledge at the Central quartz mine, near Damascus, has been struck. Its width is 5 feet and there is about 230 feet of backs on the pay chute to the old stopes above.

A recent shipment of fifteen tons of quartz from the Lost Emigrant mine, near Summit, gave a return of \$135 per ton, at the Selby Smelting Works. This mine is owned by Heath, Jacobs, Goulden & Doolittle.

SHASTA COUNTY.

The old workings and the mill on the Milkmaid mine, near French Gulch, have been closed down, the ore from these works being too low grade to pay. The Milkmaid Co. is now having a hoist and skip built in the old Wheeler shaft, about ½ mile from the Milkmaid, and will resume working on the new ground.

SIERRA COUNTY.

J. M. Harper, of Forest, will shortly commence work upon a gravel claim near American Hill owned by his company.

Development work at the Oakland mine at Gold Lake, above Sierra City, opened up the ledge in five places by shaft and tunnel work. V. C. Julian, the principal owner, says there is plenty of ore in sight, showing gold to warrant putting up a mill, which the owners are now negotiating to secure and erect before fall.

SISKIYOU COUNTY.

At the Ajax mine, near Coles, where a rich 18-inch vein was struck a few weeks ago, another rich strike has been made. The mine is owned by C. W. Martyn, W. F. Farrier, W. Everton, M. C. Gregory, D. E. McCarthy, W. Luster and F. S. Parrish.

The Summerville Hydraulic M. Co. has commenced work rebuilding the Little South Fork and Rush Creek flumes. A new crossing, or an inverted siphon, to bring water across the main South Fork, will also be put in, and the enlarging the pipe to 18 inches is being considered.

F. Smith and A. Parker Jr. of Etna have sold the Summerville hydraulic mine, near Cecilville, to the Salmon River Hydraulic Co., who intend working the claim on a more extensive scale with a large hydraulic plant.

TRINITY COUNTY.

A portable drilling machine has been shipped to the Hay Fork country, where a large area of land has lately been discovered to be gold bearing. W. O. Covert, who will conduct the prospecting, says that the Risdon Iron Works Co. of San Francisco has secured these lands and is doing prospecting. If the drilling indicates pay values the company will put ten or twelve dredgers at work and construct a power plant.

The Union Con. G. M. Co., operating the Dorleska mine, on Coffee creek, near Carrville, has developed a rich shoot of ore in a crosscut from the bottom of an 80-foot winze. The ledge is from 8 to 10 feet wide. A streak from 6 to 18 inches wide has yielded between \$11,000 and \$12,000 in three weeks from a prospecting mill working a ton a day. The company propose to install a new and larger mill this fall. Only the richest ore is now being milled, some of which returned \$1500 a ton on the plates. H. Z. Osborne of Los Angeles and M. MacIlwaine of Abram P. O. are among the principal owners.

TUOLUMNE COUNTY.

A strike has been made in the Tanzy pocket claim, at Sonora, after three years of hard search by the owners. The pocket was at a depth of 200 feet at the bottom of the incline shaft. The amount is stated to be \$15,000. Out of the same shaft, when its depth was shallow, about four years ago, A. Colby extracted a

pocket which yielded \$42,000. The present lessees of the mine are: T. C. Birney, F. Lauener and H. Munroe.

COLORADO.

CHAFFEE COUNTY.

At the present time there are about 300 men at work in the various properties in and around Newitt, near Alma. A Cincinnati company is sinking on the Silver Wave mine, leased and bonded from J. Newitt of Alma. The new company are now down 300 feet. They expect to drift to the vein, which, when cut, will be at a depth of about 500 or 600 feet.

CLEAR CREEK COUNTY.

The Mattie M. Co.'s mill near Idaho Springs has been started up. The mill is soon to be increased in capacity to 120 tons. The production now being made from the mine is considerably more than that. The principal owners of the property are W. H. Colburn and others of Denver.

J. L. Fry, on the Welsh Discovery, is making weekly shipments of ore running 600 to 750 ounces silver and \$35 to \$50 gold per ton. He has seventeen men at work. The shaft sunk 50 feet from the tunnel level shows ore the entire length. This property was idle twenty-two years and was abandoned when Mr. Fry took hold of it last winter.

The Ninety-Four mill, at Yankee, has resumed operations, using the Waugh process of dry concentration. Assays are said to show a saving of 90% of the ore values, with only 10% silica remaining. Mr. Possell, the manager, says that nearly all the dumps in the district that had been taken from the veins would pay to be treated in this mill. Much of the old Stonewall dump has been treated and proved to be valuable.

J. M. Howard has resumed development work on the Peek-a-Boo claim, in West Argentine, and is running a tunnel to find the ore body in depth that crops out on the surface above. The vein carries gold and silver.

McLyman & McGeer are cleaning up the Fort Dodge tunnel, near Georgetown. The Fort Dodge is believed to be the northeasterly extension of the Equator vein, and has shown considerable good ore.

The Old Carnival claim, owned by H. Holcomb, R. J. Manegold and T. Harris, near Argentine Pass, is said to be improving and showing a nice streak of lead ore that carries good values in gold and silver.

DOLORES COUNTY.

The owners of the Silver Swan mine, located on Expectation mountain, near Rico, and covering nearly 200 acres of mineral-bearing territory, have bonded at \$70,000 their property for three years to a local syndicate headed by Mitchell, Summers and others. Work is to be commenced at once.

J. W. Summers has men at work on the A. B. G. mine, at Burns, taking out a 50-ton lot of lead ore as a test of the practicability of mining and milling on an extensive scale. If the returns are satisfactory, arrangements will be made to work the property continuously and, possibly, put up a mill.

GILPIN COUNTY.

Arrangements have been made for development at the Red Cloud mine, in Russell district, Central City.—The new shaft building on the Delmonico property is completed. The new hoisting engine and boiler have been installed and the preliminary work of repairing and unwatering the shaft has been begun. The shaft is reported to be 400 feet deep, and the lessees will probably sink it 200 feet deeper. The property is owned by J. Ross of Leavenworth gulch, but will be operated by Louisville, Ky., parties.

S. Josephi, of the Town Topics G. M. Co., operating the East Notaway mine, in Lake district, has bought the Annex lode adjoining. The shaft is down a considerable depth on the same vein as the Notaway. As a general thing, the ore is of high grade, particularly the smelting ore.

Manager D. McMasters of the Grand Central Co. mines, at Central City, says the east ore shoot has been opened nearly 3 feet wide in the bottom of the 450-foot shaft on the East Whiting lode and averages four ounces gold to the ton. In the 200-foot level the vein carries 2 feet of \$34 ore.

GUNNISON COUNTY.

J. A. Mann, president and manager of the Horton G. M. & M. Co. of Horton, Kan., is developing the A. W. Mann property of three claims on Monumental mountain, Pitkin. The upper tunnel has been driven 200 feet and shows a 16-inch vein, assaying as high as \$125 per ton in gold, copper and silver. The lower tunnel has been driven for a distance of 208 feet, and a contract has been let for 50 feet more, which is expected to cut the vein.

The Jersey Blue Co. has its pneumatic cyanide works at Ohio City in operation. W. L. Read, president of the company,

says the mill will be kept running on the ores of the Gold Brick district.

LAKE COUNTY.

The P. O. S. shaft of the Nubian M. Co. of Leadville is having a large amount of development work done at about 500 feet down, and has recently struck a body of chlorides. The streak is not very wide, but the ore is said to run several thousand ounces to the ton.

LA PLATA COUNTY.

The Needles mining district is attracting attention from development and production of ore from prospects owned by E. Lissner of Durango.

LARIMER COUNTY.

At the Wisconsin lode, recently located by J. & J. Smith, about 4 miles west of Gleneyre, the shaft is now down 52 feet and the workings are in a vein of gray copper, carrying values averaging \$45 to the ton.

PARK COUNTY.

The Excelsior at Alma has been started up by C. N. Perkins of Denver. The work begun comprises the moving and readjusting of the cable tramway and other steps to the more extensive operation of the property.

PITKIN COUNTY.

Preparations have been made to reopen the Leadville mine at Lenado, near Aspen. Prior to 1893 this property was worked. W. J. Long and P. McRea of Aspen have taken in machinery and are doing the re-opening.

A wagon road to the new mining camp at Lincoln gulch, 26 miles southeast of Aspen, is to be constructed. The recent strike made there by a St. Louis company on the Ruby group is said to be improving under development. The company has offered to give \$1000 toward the building of a wagon road to the camp, and Aspen business men and the county will contribute the balance of the \$5000 to \$7000 needed.

SAN JUAN COUNTY.

Ore is being taken out of the Osceola, at Silverton, for trial tests. A large concentrating mill is projected, and tunnels and cuts are being run to determine the exact character and extent of ore bodies, to better design machinery required. A water power has been secured to drive machine drills and the projected mill.

TELLER COUNTY.

The sampling department of the Economic mill has been burned. The loss is estimated at from \$20,000 to \$25,000.

W. M. Moore, manager and part owner of the Empire City, says the mine is yielding ore from a drift on the 50-foot cross-cut from the 800-foot adit. Ten inches of solid smelting ore have been opened on this vein, and returns have shown as high as eight ounces gold. Over 1300 feet of underground workings have shown an average value of six to eight ounces gold.

The Cripple Creek M. Co. has been incorporated, to operate in Cripple Creek district. R. P. Russell is treasurer and general manager; J. G. Berryhill of Des Moines, Iowa, is president. The company holds a lease on the Deadwood No. 2 which has eighteen months yet to run, and also a lease on blocks 4 and 5 of the Vindicator, both of which are shipping ore. Another holding is a lease on the Rubie of the Princess Alice Co. It is proposed to sink the Rubie shaft 300 feet deeper to the 1300-foot point. It is understood that additional leases are to be acquired.

The Schuykill G. M. Co. at Cripple Creek has resumed operations on the Home Run property. J. Doyle is president and T. H. Devine secretary of the company.

Work has been resumed on the Moon-Anchor claim on Gold hill, at Cripple Creek. The main shaft is down to a depth of 750 feet and is to be driven to the 1000-foot point.

The Portland, at Victor, has started to sink the shaft an additional 200 feet. Upwards of forty veins, the greater portion of which carry pay values, have been encountered in the various workings at the tenth level. The present working force employed is 500 men, and it is estimated the output for August will be over 7000 tons.

Dalzell & Wilson, of block 11 of the Vindicator, at Cripple Creek, have made a shipment of three carloads of \$60 ore. The property is showing better values in the 300-foot workings and a much increased production is expected.

The Glorietta M. & L. Co. (King & Whiting) on the Hull City placer, at Cripple Creek, has completed the shaft an additional 100 feet and is cutting a station at 780 feet. The work of sinking will be continued without interruption until the 1000-foot point is reached.

The management of the Victor mine, at Victor, has platted its ground out in blocks for lease and has four sets of lessees at work. Brooks & Hambaugh have made a strike on their block, it is claimed,

by the first blast. They leased a block of the third and fourth levels. The first shot opened a shoot 14 inches in width that carries \$200 gold to the ton. Screenings run \$2000. Among other lessees are C. Miner and W. Camp, who are getting ore from old stopes. The royalty is 35% and the terms of the lease require no development work.

IDAHO.

BLAINE COUNTY.

W. G. Page, Supt., states that the Croesus mine at Halley, which has been idle for several months, will probably be sold soon and started up again. The mine is kept pumped out and is in shape for the extraction of ore, which will begin without delay.

BOISE COUNTY.

The Mineral Hill quartz mine on Ophir creek, between Placerville and Pioneer, has been sold by J. Merrill, J. Lamberton and J. Hanley of Placerville to Ormsby & Co. of Boise, the price reported being \$20,000, part cash. It is expected that the mine will be extensively developed.

The Gold Fork mine, located on Payette river, has been sold by M. B. McGlenn to J. C. Blood of Denver, representing Eastern people. The new owners of the property will, it is said, build a dredger at once.

IDAHO COUNTY.

(Special Correspondence).—The group of mines belonging to the Idaho Reduction & Power Co. is located near Rapid river, a few miles above Pollock, the latter point being at the outlet of the Rapid into the Little Salmon. This company, whose main office is in Denver, Colo., has made a shipment of machinery from the latter place to build a stamp and concentrating mill and also a sawmill. The mill will have twenty-five tons daily capacity to begin with, but it is to be enlarged later. The stamp mill will be operated by water power and the sawmill by steam.

The last Idaho Legislature appropriated \$12,000 to build 20 miles of wagon road from Pollock up the Little Salmon, making a connection between similar State roads to the north and south. The appropriation did not prove sufficient, and the Oregon Short Line and P. & I. N. Railroads came forward with an additional \$6000, and as a result the road will soon be complete. A great deal of the supplies will then go in by way of Council and down the Little Salmon. The large number of claims located along the Little Salmon and Rapid rivers is an indication of the interest being taken in this section of country.

Pollock, Aug. 13.

The Midas G. M. Co., controlled by Finch & Campbell, expects to put the 10-stamp mill on the Ajax, at Dixie, in operation immediately. There is claimed to be enough ore blocked out to run the mill for a year.

A 10-stamp mill will be installed on the Utopia mine at Grangeville soon.

W. H. Regua reports that a rich placer strike has been made by a man named Childs, about 10 miles from Elk City. Mr. Childs takes out about \$500 every week.

F. J. Conroy of Baker City, who is an owner in the Last Chance, Monarch and other mines at Atlanta, says that at the mines twenty-two men are employed, with C. Lange of Boise, Supt. The old tunnels on the Monarch are being cleared and the water is being taken out of the main shaft of the Last Chance. He further states that there are some thousands of tons of \$6 ore on the dumps of the mines. At present this ore will be milled and concentrated, but if the mines when opened show considerable quantities of similar ore it is likely a chlorination plant will be put in. It is the intention to add ten stamps to the mill.

A. E. Mohr of Dayton, O., has made a strike of a ledge reported to be 2 feet wide near Pierce City. The ore shows much free gold.

SHOSHONE COUNTY.

Larson & Greenough's Morning M. Co. has struck ore 1700 feet in No. 6 tunnel, which is being driven from the mill. The tunnel will be 2 miles long when completed and many big ore bodies are expected to be cut before the You Like and Morning veins are cut.

The tunnel on the Springfield copper mine on Stevens peak, near Wallace, has cut the ledge and found 6 feet of ore, showing values of \$22.62 in gold, silver and copper.

MONTANA.

GRANITE COUNTY.

The American G. M. Syn., incorporated by the McLure Syndicate of St. Louis, Mo., has bought the Sweeney sapphire claims on Rock creek. The syndicate has been working both properties for some time and has opened a lapidary shop in Helena with W. E. Knuth, manager, to cut the stones before shipping them for sale. The Rock Creek mines consist of

both placer ground and the porphyry reef, in which are found not only blue sapphires, but many shades of pink and green. This syndicate is believed to have acquired all the known sapphire ground in Montana except those of the New Sapphire Mine Syndicate and the bars of the Missouri river, which have not been worked.

JEFFERSON COUNTY.

It is reported that the Basin & Bay State M. Co. is to resume operations under F. P. Chapin, president of the company.

Ax, Downey & McLaughlin, the owners of the Ada mine, have men at work on their mine at Basin. The ore carries considerable copper and will be shipped.

At Gray Eagle work is being pushed by the company that ex-Governor Lind of Minnesota is interested in, and he is at the mine. The bond is for eighteen months and the price is said to be about \$80,000. N. Lind is the assayer in charge.

W. J. Heaney, Supt. of the Cataract Copper Co., says the company is doing development on the Bullion, Blue Grouse and Crystal claims, and that there are from 2 to 7 feet of shipping ore in every shaft and tunnel.

L. S. Wild of Butte is working the Monarch mine, near Bernice, in the Lowland district. He has a lease and bond at \$22,000 for eighteen months.

H. Schmidt has made a strike on his quartz claim, near Whitehall. The claim, known as the Black Eagle, has been developed to a depth of 40 feet, and at that depth shows a vein of gold-bearing quartz 2½ feet in width, assaying \$75 per ton.

LEWIS AND CLARKE COUNTY.

The Howard mine, near Helena, operated under bond by C. A. Sheldon, has commenced making ore shipments.

The Montana M. Co. is preparing to abandon the lower workings of the Drum Lummon mine at Marysville. The pumps will be pulled and the lower workings from the seventeenth to the fourth level will be abandoned. The company proposes to develop other properties in the neighborhood of Marysville. It recently shipped 30 of its 110 stamps to Idaho, where it is engaged in mining.

Fetter Bros. and associates of Kansas City, Mo., and E. E. Stephens of Ogden, Utah, have bought the Black Pine mine, on Copper creek, near Helena. They have been operating the mine under bond for two years. Arrangements to work the property upon a more extensive scale have been made. The price paid for the mine is said to be \$15,000.

In the Penobscot mine at Marysville, operated under lease by M. A. Alderson of Helena, ore has been struck in the Leopard and Snowdrift vein, where the former owners had run off the ore bodies.

J. V. Cole of Marysville has struck the ledge at the head of the tunnel on his property near Bald Butte. He has shipped two cars of ore running from \$70 to \$80 a ton from the upper levels.

The North Star mine at Marysville has been leased by T. Cruse to P. Dillon, and it is reported that the latter will put fifty men to work in it.

It is expected that the 500-ton cyanide plant at the Empire mine will be started about September 15. The mill will first treat the tailings, of which there are 75,000 to 100,000 tons in the dam. It will then work ore from the mine.

The 100-ton cyanide plant recently erected has started to treat the tailings of the Prize mine at Granite Butte, 18 miles from Marysville.

The shaft on the Ophir, at Blackfoot City, is said by T. Hurd of Spokane, Wash., one of the owners, to be down 110 feet on a vein of 4 to 5 feet of ore. The ore carries from 8% to 10% copper and some carries silver and \$4 or \$5 in gold. There is a steam hoist, capable of going down 500 feet, and pumps on the mine. M. Mitchell, T. Garrison and W. Y. Clark of Spokane, Wash., are interested with Mr. Hurd in the mine.

MADISON COUNTY.

The Watseka mine, at Rochester, owned by C. Hand of Butte, A. W. McCune of Salt Lake and the estate of W. L. Hoge, is claimed to be one of the richest gold mines in Montana, the first-class ore going from \$100 to \$400 a ton and the second-class from \$18 to \$20. The former comes from a shoot from 1 to 4 feet wide on the 300-foot level and the latter is taken from a vein from 6 to 10 feet wide. The first-class ore is shipped, but the second-class is treated at the mine.

J. F. Dulles and others are working the Hudson copper mine at Silver Star, and are said to have a bonanza. The shaft is down 300 feet and the lead is said to be getting stronger and richer as depth is attained. The ore averages 21% copper.

At the corundum mine near Camp creek fifteen more men have been put to work and considerable machinery has been ordered by the owners, H. Kirk, F. L. Kline and others of Bozeman.

POWELL COUNTY.

J. Minchin, of Boston, Mass., acting for New England people, has bought a large interest in the Ptarmigan group of mines owned by T. Cooney, C. J. Fulton and others of Helena. The property comprises fifteen mines, some of which are well developed, and from which shipments of high-grade gold ore have been made to the value of \$100,000. Development of the entire group will be prosecuted this fall and winter by a tunnel driven on the main vein at a point admitting a depth of 1200 feet on the ore bodies. A large milling plant will subsequently be erected for the treatment of the ore by amalgamation, fine concentration and cyaniding. The new company proposes to develop water power from the Big Blackfoot river through 2 miles of ditch, by which sufficient fall will be gained to give 145 H. P. at the mill.

SILVER BOW COUNTY.

After suspension for two years one of the stamp mills of the Alice M. Co. at Walkerville will be started up. Workmen have put the machinery in shape and are making other repairs about the plant. A cyanide plant will be added to the mill.

The Montana Ore Purchasing Co. at Butte is handling very little custom ore at present. It is said to be treating about 1000 tons of ore per day from its own properties. The producing mines are the Rarus, the Minnie Healy, the Clinton, in Park canyon, the L. E. R. and the Cora. The L. E. R. is down 600 feet and several adjoining properties are worked through this shaft.

C. Stowbridge, manager of the Brown's Gulch Homestead Co.'s mine near Butte, reports that the vein has widened to 4½ feet. The shaft is down 195 feet. At 170 feet the ore returned an assay value of \$96 gold per ton. The new machinery recently installed is working well.

NEVADA.

LINCOLN COUNTY.

The plant of the Mineral Union Con. Co.'s mines, situated at Goode Springs, which was erected in 1898 and 1900 at a cost of about \$80,000, has been bought by S. H. Lucas of Los Angeles, Cal., who proposes to remodel the works into a concentrating plant, with a capacity of 100 tons daily. It is expected that the railroad, now toward Goode Springs, will be completed to that place by January 1st. A copper matte smelter will then be added to the works.

T. R. Jones, J. Eisenman and others have sold to G. C. Fetterman of Pioche the Magnolia group at De Lamar for, it is reported, about \$100,000.

ORMSBY COUNTY.

A promising find has been made in the Gardner mine, near Carson. At a depth of about 60 feet a body of copper ore 2 feet wide has been encountered. The ore consists of chalcocite and bornite. The mine is located on a mountain of quartz, from which assays of gold and silver average from \$1.50 to \$2.75 per ton. A 5-stamp mill has been started at the mine and returns are \$2 a ton.

WASHOE COUNTY.

On the Gulling ranch, near Reno, a lead about 3 feet wide of hard quartz with an iron capping has been found. Outside of a rich stringer the lead assays \$12 a ton in gold. A shaft is being sunk on it. The mine is owned by Gulling Bros., Branley, Henry & Spencer.

NEW MEXICO.

GRANT COUNTY.

The Arizona mine, near Pinos Altos, owned by St. Louis people, is being worked under lease by W. McAllister of Silver City. The ore, which is pyritic, runs heavy in gold, silver and copper. Most of the mining is being done on the 75 and 155 foot levels. At this latter level is a 3-foot vein of gold-bearing ore of too low a grade to bear shipment to the smelter, but which, if concentrated, would pay. The lessee is considering the advisability of erecting a concentrator, the water problem being the greatest obstacle to overcome.

Owen Bros. have completed a 175-foot tunnel on their Copper Belle and Independence mines on Hanover mountain, at Fierro. In driving the tunnel several strata of rich ore were met with, some of it assaying as high as 42% copper. The work will be continued.

The Modoc, which is being operated by the Phelps-Dodge people at Fierro, has reached a depth of 200 feet in the incline shaft. The ground is becoming softer and great quantities of water are being encountered, requiring large pumps to keep it down.

RIO ARriba COUNTY.

The Bromide mine at Bromide is in operation, a Colorado company having taken a fifteen years' lease on it and commenced operations.—The Copper Knot mine has been secured by V. E. Lawton

of Chicago, who will develop it. C. Taylor is Supt.—The P. M. & M. Co. has let a contract for 100 feet of crosscutting and will cut the Elliott lode at 180 feet from the surface.

OREGON.

BAKER COUNTY.

The Turnagain Arm G. M. Co. has bought from H. Shurtliff, W. Young and J. Smith the Cable Cove and Ceda mines for \$10,000. The properties are near the California mine, which the company bought.

Grant and Baker counties and owners of the Baby McKee and Free Coinage mines have decided to build a wagon road from the Free Coinage mine to the Baby McKee, thence via the California to Cable Cove, and from there via John Day divide down the middle fork of the John Day river, connecting with one of the main county roads. The total cost will be \$4000, one-half of which will be paid by the mines and the other half by Baker and Grant counties.

J. L. Hunter and J. Bruner are leasing the Worley mine. The tunnel is in 280 feet. A crosscut will be run to tap the main ledge about 70 feet below the surface. The ore, as milled, runs about \$100 to the ton.

W. L. Vinson, manager of the Gem mine at Sparta, has bought a 10-stamp mill at Robinsonville and has had it removed to Sparta. The plant of the Gem will be increased to forty or fifty tons daily capacity.

JOSEPHINE COUNTY.

The Fortune M. Co. has been incorporated, capital \$50,000, by O. S. Goodnow, J. Ward and J. L. Wiggins. The company is developing a number of quartz properties in southern Oregon, among them the Horseshoe mine on Foots creek, near Grant's Pass, where a 5-stamp mill is now being constructed.

J. R. Harvey of Grant's Pass, manager of the Old Channel hydraulic mines, in the Galice Creek district, states that preparations are being made for a big run this coming winter. The mines were recently bought by Eastern people for \$90,000.

Reports from the Mountain Lion mine, on Applegate river, near Grants Pass, say the ledge—all mill rock—is from 4 to 5 feet wide, and the rich pay streak from 3 to 18 inches. The tunnel is now in about 800 feet. The owners are Jewell, Harmon & Bailey Bros.

LINN COUNTY.

C. W. and C. M. Young have transferred their option on the White group, in the Blue River district, near Eugene, to J. E. Blazier. Among the claims covered by the option are the Sunset and Yankee Girl. It is the intention to continue development work and in a short time erect a small mill.

SOUTH DAKOTA.

PENNINGTON COUNTY.

The Cochran mine, at Rochford, is said to be producing very rich ore from a shaft in the ore shoot which is estimated to be 75 feet wide and 400 feet long. J. Cochran is the owner of the mine.

The Best M. Co. has opened a mine near Rochford in Hornblende camp. A tunnel has been run about 400 feet which has cut through a ledge of free-milling ore over 30 feet wide. The assays run from \$2 to \$5 per ton gold. The company is composed of Malvern, Iowa, people. It is planned to build a small stamp mill. G. Best, formerly of Bayfield, Wis., is president of the company, with office at the mine.

It is reported that the Black Hills Belt Dev. Co. has obtained a water right and mill site on Rapid river, near Rochford, and that work has been commenced on a flume to take out the water for the mills.

The Standby mine, at Rochford, is to be reopened after being closed down for six years. It is owned by New York people. A 1500-foot tunnel at the ore-bin level of the stamp mill taps the main ledge. The ore shoot is very large, and in many ways said to be like the Homestake. The owners are planning to put in concentrators at the 60-stamp mill and add a cyanide plant.

UTAH.

BEAVER COUNTY.

The Golden Reef M. Co. has been incorporated at Milford, with a capital of \$100,000. D. W. Woodard is president and H. N. Hayes secretary. The company owns the Golden Reef and eleven other mining claims.

J. E. Kingsbury, formerly of Stockton and now of Park valley, Box Elder county, is reported as having secured a \$20,000 option on the old Monte Cristo group, near Frisco, for Eastern people, who will start the mine up.

The Blue Jay Extension M. Co. has

been incorporated, capital \$5000. F. Sugden is president and L. H. Gray secretary. The company owns the Blue Jay Nos. 1 to 6 mining claims and a lease on the Blue Jay and Trojan and Mona claims, in the Washington mining district.

The Golden Reef M. Co. has been incorporated at Richfield, Sevier county, with capital \$100,000. The company owns the Golden Reef and eleven other claims near Frisco. D. W. Woodward is president and H. N. Hayes secretary, with office at Richfield.

The Majestic M. Co.'s mine near Frisco, A. B. Lewis of Salt Lake City president, has recently shipped ten carloads—258 tons—of ore, which went 40% copper, \$4 gold and 7.6 ounces silver to the ton. The shipment came from the O. K. claim of the Majestic group. The total value of the shipment was \$30,000, at the rate of \$116 per ton. The ore will net to the company about \$100 a ton. It is the intention of Mr. Lewis to proceed at once with the construction of a big smelter for the joint use of the Majestic, Imperial and Royal Companies. It will be of a sufficient capacity to take care of all the ore produced that the management may care to handle on the ground. The mines are on the Frisco branch of the Short Line, so that the transportation problem does not have to be solved. The ore just shipped was not the first shipment from these ledges. About twenty-five years ago seventy-five tons, which averaged 69½% copper, were taken out and sent to Baltimore, where the only copper smelter then in operation in this country was located. At that time copper was not so valuable as it is to-day, and the work of developing the mines was allowed to lapse.

BOX ELDER COUNTY.

L. B. Hughes, W. H. Dodge and J. Snell of Salt Lake City, owners of the El Amigo mine, in Park valley, have decided to equip the mine with a 5-stamp mill, which will be put in immediately.

The Century M. Co. has decided upon a water route across Salt Lake to supply their mine and mill in Park valley, and are now gathering data upon the cost of equipment. The proposed route is from a point on the south shore to a landing about 6 miles west of Kelton; thence to the mine, the distance will not exceed 30 miles, the haul exceeding that between the mine and Kelton by about 6 miles only. To take in supplies and bring out concentrates a scow propelled by gasoline engine is already being arranged for. The condition that led up to the development of the water route is said by one of the company to be railroad freight rates. For the carriage of 5000 pounds of concentrates from Kelton to the Germania smelter, near Salt Lake, the railway had taken, it is said, \$119.50, or nearly \$50 per ton, while for a ton of \$4 coal which is taken into the camp the company is required to pay \$4.50 freight.

JUAB COUNTY.

The Carisa C. & G. M. Co. has been incorporated, with \$625,000 capital, with office at Salt Lake City. C. K. McCornick is president and J. S. Gard secretary. The company owns the Carisa, Miner's Delight, Wolf, Northern Spy, Jim Fisk, Cordelia Orton and Victor mining claims and two-thirds of the California, Nevada and Lake View claims at Tintic.

The St. Louis M. Co. has been incorporated, capital \$30,000. The company owns the St. Louis No. 1 to No. 4 mining claims at Tintic. W. Hedrick is president, J. W. Hatfield secretary and treasurer, with office at Salt Lake City.

PIUTE COUNTY.

The Silver Cave M. Co. has been incorporated at Junction, capital \$20,000. J. A. Hill is president and A. Jensen secretary and treasurer. The company owns the Silver Cave group of mines in the Mount Baldy mining district.

SAN JUAN COUNTY.

The International Copper Co.'s mine at La Sal is showing up satisfactorily. Two veins have been opened, in one of which the ore runs 8% to 15% copper, with small gold and silver values. S. A. King, J. W. Burton and T. Rosecamp of Salt Lake City are among the principal owners.

SALT LAKE COUNTY.

J. H. R. Thompson, B. T. Hickman and M. C. Smith have bonded the Centennial group at Bingham from C. H. Lashbrook, and with Mr. Smith as manager have begun work on it. A lower tunnel, now in 200 feet, is being driven to cut a cross vein.

The Mystic Shrine mine at Bingham is being operated under bond and lease by M. McGrath.

With 4000 tons of ore estimated as blocked out in the Silver Hill (Red Wing) claim at Bingham, the construction of a gravity tramway to the dump at the gulch bottom is under consideration. It is estimated that the tram would reduce transportation expense 60 cents per ton.

The Cornucopia M. Co. has been incor-

porated, capital \$30,000. E. H. Green is president and J. J. Whitaker secretary. The company owns the Horn of Plenty group of mining claims in the Big Cottonwood mining district.

The Western Exploration Co. has been incorporated in Salt Lake City, capital \$1,000,000, to operate the Sampson Co.'s mine and a half interest in the Yosemite mine at Bingham; control of the Boss Tweed group at Tintic; the option on the New Pass group in Lander county, Nev.; the Crown Point group of Elmore county, Idaho, and other properties. The company will manage the affairs of each company from one office and with the same management staff. W. F. Snyder has been made president, W. G. Filer vice-president, secretary and treasurer, G. Snyder assistant secretary, these officers, with P. S. Kimberly of Sharon, Pa., and B. Snyder, forming the board of directors.

SUMMIT COUNTY.

The Martin G. & S. M. Co. has been incorporated, with \$30,000 capital. A. F. Martin is president and B. E. Hartwell secretary and treasurer. The company owns the Deer Trail and other mining claims in the Uintah mining district.

The David M. Co. has been incorporated with \$150,000 capital and office in Salt Lake City. J. Duffy is president and E. McGurrian secretary. The company owns the Black Bear and other mining claims in the Uintah mining district.

A. H. Steele of Salt Lake City, secretary of the Western Monitor M. Co., operating at Park City, states that they are driving the tunnel 75 feet farther in to strike the vein. It is a copper proposition, with ore said to go \$100 to the ton.

The Martin G. & S. M. Co. has been incorporated in Park City, with capital of \$30,000, to operate the Martin mine in Thayne's canyon.

TOOELE COUNTY.

At the Honerine mine at Stockton a three-compartment shaft is to be sunk to the 900-foot level before drifting from it. C. H. Scheu is manager.

WASHINGTON.

COWLITZ COUNTY.

The Darnell M. & M. Co., capital \$720,000, has sunk a 300-foot shaft at Kalama. The mine will ship two carloads of ore daily until its own smelting works are built. A contract has been let for a 40-ton reduction plant. The ledge in which the company is now working is about 30 feet thick.

CHELAN COUNTY.

Part of the grade between Lake Chelan and the Holden mines has been completed by the Chelan T. & S. Co., which expects to build a railway to the mine. T. Maloney is manager of the company.

The American Flag Co. of Spokane, working the American Boy at Methow, has its 20-stamp mill completed. C. Anderson, vice-president of the company, says the company has done between 2000 and 3000 feet of development work and opened a fine body of free milling ore. It is planned to put in a cyanide plant later to treat the tailings. An electric light plant is just completed. The mine is working about thirty-five men. The American Flag Co. is controlled by T. S. Griffith, F. R. Insinger, C. Anderson and M. McKane of Spokane and H. Cornwall of Colfax.

FERRY COUNTY.

Work is to be resumed on the Scotia and Champion, on Kettle river. C. E. Hoffman of Spokane is Supt. A tunnel over 100 feet has been run; also, a 50-foot shaft sunk. Thus far the showing is good. The company expect to place both the Scotia and Champion on a shipping basis this fall.

The Phil Sheridan, at Republic, which is under bond and lease to J. Cronin, is showing up well. The ore body is 4 feet in width and said to go about \$50 per ton. The ledge has grown stronger and more uniform in width and value from the surface to the present level.

E. J. Delbridge, superintendent of the California mine at Republic, operated by the Apollo G. M. Co. of Hartford, Conn., says the mine is improving with every foot of development. There is 2 feet of ore in the bottom of the 400-foot shaft and good ore in the levels. Thirty men are employed about the mine. Six hundred tons of shipping ore is on the dump.

Discovery claim of the Granite Creek placers at Republic is now running with five men employed cleaning bedrock. There is about 5 feet of gravel that is being shoveled into the sluices. Large boulders make the work progress slow. The bedrock is soft granite. The owners are said to have refused several offers to buy the claim.

D. C. Jackling, late manager of the Republic mill, states that the closing of the mill was due solely to inability to get enough ore from the Republic mine for running the plant. "The charge has

been made that the mill was not suited to the ore found in the lower levels of the Republic." Mr. Jackling says that the charge is not true. "The mill was completely successful. From the time that it started up to the close of operations we recovered 91% of all the gold in the ore submitted to us. We recovered 85% of all the values, including silver. There seems to be a misapprehension with regard to an increase in the amount of silver with depth. The silver values of the Republic mine did not average \$1.50 per ton. The greatest assay in silver ever got from a shipment of Republic ore was five ounces, or less than \$3. The mill was in operation somewhat less than nine months. In that time we handled custom ore from the Tom Thumb, the Ben Hur, the Quilp, the San Poil, the Black Tail, the Pearl and the Lone Pine-Surprise. The average of those ores was three and one-half ounces, or about \$2 per ton in silver. Owing to inability to get ore, the mill never had a chance to work at its full capacity, which was 5400 tons a month. Consequently we never had a chance to show what the mill would do in the way of economical operation under normal circumstances."

KING COUNTY.

The Seattle Smelting & Refining Co. has been incorporated by J. Mayer & Bro. of Seattle and R. L. Whitehead of Philadelphia, with capital \$25,000. The company has leased for five years a building in Seattle which is to be immediately remodeled and a plant put in. Gold, silver and platinum will be handled at the beginning, but it is the intention later on to supply equipment for the refining of copper and lead. J. Mayer is president and R. L. Whitehead secretary and manager of the company.

LINCOLN COUNTY.

The Turk M. & M. Co. is planning the erection of a 50 or 60-ton smelter at Cedar canyon, on property owned by the company, 7 miles from the Spokane river. A. W. Turner is president and H. A. Turner secretary of the company, with office at Davenport.

PIERCE COUNTY.

Denver, Colo., people propose to build a large smelter at Darrington, the new mining town in the Cascade mountains, to which the Northern Pacific branch has just been extended. A written proposition to owners of Darrington mines has been submitted, asking for a location for a smelter, together with guarantees of water power and 2000 tons of ore monthly carrying 3% copper. F. Perkins of Colorado Springs, Colo., represents the Denver people.

SPOKANE COUNTY.

The American Placer M. & M. Co. has been incorporated at Spokane; capital, \$150,000. The trustees are W. H. McVey, W. D. Wrighter, W. O. Jones, D. C. Wrighter and J. H. McVey of Spokane, B. Baumann of Chicago, Ill., and T. A. Noble of Pittsburg, Pa.

WYOMING.

BIG HORN COUNTY.

J. C. Schnitzel of Deadwood, S. D., has bought nine claims and a one-half interest in the Beyam mine at Kirwin. The prices paid range from \$100 to \$2500.

FREMONT COUNTY.

The Carrissa gold mine near South Pass is to put in a 200-ton cyanide mill at once. Owners of this mine claim they have over 200,000 tons of ore blocked out that will average about \$16 per ton. The company will put on an automobile between the mine and Point of Rocks, on the Union Pacific, to haul supplies to the mine.

FOREIGN.

BRITISH COLUMBIA.

The Prospector's Exchange of Nelson says the manager of the Noble Five M. Co. reports work done during July on the mine near Slocan: In tunnel a crosscut has been driven 133 feet toward the Last Chance ledge. Last Chance tunnel No. 3 has been drifted on the ledge 35 feet, cutting three shoots. Twenty-four tons ore shipped to the smelter returned \$80 per ton.—The B. C. Copper Co., Greenwood, has contracted with the B. C. mine for the treatment of 200 tons of ore per day. The smelter will soon be in position to treat 800 tons per day.—The Great Dane group of mines, Fort Steele division, has been purchased by J. C. Drewry for \$40,000. There are two strong ledges on the property; one, from 9 feet to 12 feet wide, carries between 4½ feet and 5 feet of solid galena; the second ledge carries about 2½ feet galena ore. Sawyer Bros. have taken a contract to run a 200-foot tunnel on this group.—F. Robbins, manager of the North Star mine, in East Kootenay, says that about 1000 tons of ore are being extracted per month. The mine has paid five dividends of \$39,000 each, or a total of \$195,000.—A group of fifteen claims at

Kitchener, East Kootenay, has been bought by a Montreal syndicate for, it is said, \$100,000 cash. The claims contain a continuous body of high-grade hematite iron ore, varying from 50 feet to 200 feet in width. Best assays show 66% metallic iron, 2% silica, .03% sulphur and a trace of phosphorus; the average of twenty assays taken from different parts of the property give: metallic iron, 55%; silica, 10%; sulphur, .05%; phosphorus, .01%.

—Arrangements have been made at the Arlington mine, Slocan, for shipping 1000 tons of dry ore monthly.

Nelson, Aug. 17.

J. C. Drewry of Rossland has bought the controlling interest in the Great Dane mine, including the Great Dane, White Star and Fisher claims, situated on Morris creek.

The Canadian King M. Co., operating near Erie, has bought a three-drill compressor. J. C. Odell is president of the company.

Sixteen men are in the Rainy Hollow country, near Porcupine, doing assessment work. J. Smith, one of the original locators, is developing his claims. Captain Jarvis of the Northwest Mounted Police at Pleasant Camp, is an owner of claims in the district. The district is near the head of the Klehena river, on the Dalton trail, and was discovered late in 1898. Copper is found there in bornite, chalcopryite and malachite, occurring in veins from 18 inches to 2 feet in thickness. Assays of copper ores from this region run from 20% to 55%. The district is 50 miles from Pyramid Harbor.

Figures compiled by the American S. & R. Co. show that the total output of the provincial lead mines for the six months ending June 30th was a little less than 30,000 tons. Of that 9000 tons were furnished by the St. Eugene in East Kootenay and treated at European smelters. The rest was handled at the Trail and the Hall Mines smelter and at the plants in the United States outside the smelting trust. The St. Eugene is now closed down on account of the market. The North Star is still shipping on contracts. The Payne is idle. Shipments from the lead mines of the Slocan amount now to only about 100 tons per week. The Rambler-Cariboo, the Slocan Star and the American Boy are about the only producers.

F. A. Heinze of Butte, Mont., and several associates, have bought the controlling interest in the Britannia copper mine at Howe sound, 30 miles north of Vancouver. About \$300,000 is said to have been paid for 51% of the stock. It is proposed to erect a large smelter on the property at the water's edge at once. The Britannia mine is composed principally of a series of copper-bearing bluffs, in which there are now several million tons of ore, either blocked out or in sight, ready for easy mining.

H. Donough says of Franklin camp, situated on the east fork of the north fork of Kettle river, about 45 miles from Grand Forks, that the mineral showing of that section surpasses, if anything, the Boundary. The ledges are large, the formation favorable, and the values in gold, silver and copper are very good. An open crosscut 12 feet wide and 16 feet deep on the Banner is all in ore, and the walls on either side have not been reached. This ore will average \$20 per ton. A crosscut tapping the hill at a depth of 250 feet has traversed over 30 feet of \$8 ore.

A consolidation has been made by the Athabasca G. M., Ltd., and the Venus G. M. Co., under the name of the Athabasca Con. Co., with head offices at Ontario. The Athabasca at Ymir has a stamp mill and cyanide plant, which have been practically idle from lack of ore in the Athabasca vein. The Venus mine has no mill, but between 16,000 and 20,000 tons of ore have been already blocked out. This ore, which averages \$16 per ton, is sufficient to keep the stamp mill at Athabasca in full work for two years. The two properties are about 1/2 mile apart and an aerial tramway will be built to cover the distance.

MEXICO.

C. O'Keefe, president of the Sonora M. & M. Co., operating silver properties in the Altar district in Sonora, has had the La Fortuna, Sernena, Esperanza, La Fortunita, Penasco Quemado and Siglo Nuevo claims connected by wagon road. J. W. Walsh, the mine superintendent, has a large force of men getting out ore.

THE KLONDIKE.

J. R. McGovern of Dawson says that in his opinion winter work in the Klondike will be discontinued and the summer season adopted. The creeks which produced the large amounts of gold at the first of the Klondike excitement would not now produce gold in large quantities. Gold in paying quantities, however, could continue to be taken out if they were worked in summer. Eldorado and Bonanza creeks were particularly referred to. Hunker and Dominion have turned out well this

season, but the Eureka has not come up to expectations. The Rob Roy, according to Mr. McGovern, has done nothing this year as yet.

Personal.

W. CHINO, Supt. Shannon copper mine, Clifton, Ariz., is in Europe.

D. C. JACKLING has resigned as Supt. Republic mill, at Republic, Wash.

J. MARTIN has been appointed Supt. Copper Mountain M. Co., at Stoddard, Ariz.

G. CRANE has been appointed Supt. Arizona G. & C. Co. Smelter, Patagonia, Ariz.

J. P. TURNER has resigned as Supt. Ashbrook mine, in Box Elder county, Utah.

S. W. TYLER, M. E., has returned to Denver, Colo., from extended work in Arizona.

H. P. BAKER, manager Garfield mine, at Brigham City, Utah, has returned from New York.

A. R. BENZIE, Supt. Plata Cobre copper mine, in Pinal county, Ariz., is in Denver, Colo.

T. S. LAWLOR has been appointed on the office staff of the State Mining Bureau at San Francisco.

M. DUFFY of Cripple Creek, Colo., has been appointed Supt. Minnie Moore mine, at Hailey, Idaho.

J. E. BEVERIDGE of Salt Lake City, Utah, has been appointed manager New Pass mine, near Austin, Nev.

A. STAHLGREN has resigned the position of mechanical engineer of the Mountain Mines, Ltd., Keswick, Cal.

W. DAVIDSON of Salt Lake City, Utah, has returned there from a professional trip to Prince of Wales Island, Alaska.

E. J. GILBERT, formerly a Supt. for the California Ex. Co., Tuolumne county, Cal., is now Supt. Mowry mine, Mowry, Ariz.

T. FISHER of Helena, Mont., has been appointed Supt. of construction of the 100-stamp mill to be built by the Amalgamated Copper Co. at Pony, Mont.

P. C. DUBOIS, field assistant to the State Mineralogist of California, is examining the copper deposits of Madera, Fresno, Tulare and Kern counties, Cal.

HERBERT WATERMAN of the Hendrie & Bolthoff Mfg. & Supply Co. of Denver, Colo., returns this week from San Francisco, Cal., where he has been making an extensive sojourn.

W. B. GESTER of Newcastle, Cal., and late of Saucillo, Chihuahua, Mexico, is now manager Unity M. Co. and the Bully Choop M. Co. of New York, operating in Trinity county, Cal.

Catalogues Received.

Machinery Catalogue No. 9, issued by the Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo., making an admirable reference book for those connected in any way with the mining industry, contains fine engravings of all types of standard machinery and equipment for mines, mills and smelters, accompanied by careful descriptions thereof, with valuable suggestions on erecting and operating. The work includes numerous well executed designs of modern milling plants. Among the illustrations are observed neat cuts of new machines for shop work. The catalogue is alphabetically indexed, so that any subject may be found with no delay.

THE Pelton Water Wheel Co. has issued the eighth edition of its Trade Catalogue, revised and with additions. In addition to the English edition, one in Spanish has been issued for Spanish speaking countries. Like the preceding editions, this one contains much useful tabulated information relating to the use of water for power. The company will be pleased to mail the catalogue on application to their home office, 125 Main street, San Francisco, Cal., or to the office of their Atlantic department, 143 Liberty street, New York.

Recently Declared Mining Dividends.

Commercial Paragraphs.

H. S. SANDS AND F. P. WOOD, electrical engineers, have formed a partnership and opened an office at 1033 Seventeenth St., Denver, Colo.

THE Benicia Agricultural Works, Benicia, Cal., will, on receipt of drawings, furnish estimates for castings for machine, smelter and structural work.

THE Stilwell-Bierce & Smith-Valle Co. of Dayton, Ohio, have just shipped to the Cardiff Coal Co., Keddick, Ill., a Stilwell improved feed water heater and purifier, another to the Tug River Coal Co., Tug, West Va., and a third to the Pittsburg Coal Co., North Star, Pa.

H. V. CROLL, who has been manager of the Spokane, Wash., branch office of the Edward P. Allis Co., has been appointed manager of the branch office to be established at 414 Dooly Block, Salt Lake City, Utah, for the Allis-Chalmers Co., with the territory of Utah, Nevada, Montana and southern Idaho under the direction of that office.

THE Clot & Crist Machine Co., 137-139 Beale St., San Francisco, has recently applied for a patent on a direct-acting steam pump, specifications of which cover some novel features relating to steam chest, valve movements, etc. The moving parts are case-hardened and interchangeable, and while tightly closed in, are easy of access by the removal of half a dozen nuts. These pumps have been tested, and fifteen of different capacities are reported under construction on orders.

J. GEO. LEYNER, manufacturer of air compressors and drills, Denver, Colo., recently supplied compressors and drills for the following properties: The Carr mine, Central City, Colo.; the Centennial mine, Georgetown, Colo.; the Idaho Springs Gold Producing Co., operated by Marshall Bros. of Georgetown, Colo.; the Modoc M. Co. at Las Cruces, N. M.; the Aberdeen Copper M. Co. at Lordsburg, N. M.; shipped a six-drill compressor and four drills to a point in Alaska; are building a compressor and drills for the Empire Tunnel Co. at Empire, Colo.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SACK HOLDER.—No. 680,381. Aug. 13, 1901. W. M. Inman, Randsburg, Cal., and C. C. Inman, Bishop, Cal. This is a device for holding the mouths of sacks open for the purpose of filling. It consists of standards, and a base to which they are fixed, means for adjusting the standards vertically, an elastic extension to one of the standards, and both extensions having their upper ends curved and provided with transverse spreaders with sack-engaging hooks so that the latter may be attached and the sack held open until properly filled.

FURNACE FIRE DOOR AND ATTACHMENT.—No. 680,369. Aug. 13, 1901. F. L. Bates, San Francisco, Cal. This invention consists in the construction of a horizontally divided two-part door, the lower part of which opens about a vertical hinge on one side, and the upper part opens downwardly about horizontally disposed hinges upon the lower part, so that the fuel may be introduced through the open upper portion. An inclined guard plate serves to direct the fuel to prevent its catching and turning on the door opening, a horizontal slot on the upper part of the door casing, and an air-deflecting plate serves to direct air into the furnace and assist in the combustion.

STRESS APPARATUS.—No. 680,371. August 13, 1901. H. M. Brittan, San Francisco, Cal., assigned to American Steel & Wire Co. same place. The apparatus is designed for testing wire rope cables and the like to ascertain the breaking strain. It consists of a cylinder and a piston, yokes connected with the cylinder and with the piston, extending in opposite directions, said yokes including arms having turned ends secured respectively to the heads of the cylinder and the piston. The yokes carry devices for the attachment of the rope or part to be tested, and means for indicating the tension upon this part.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING AUGUST 13, 1901.

Latest Market Reports.

SAN FRANCISCO, Aug. 22, 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 58½c (1000 fine); San Francisco, 58½c; Mexican dollars, 47c San Francisco, 45c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £66 5s per ton.

It is reported that the world copper combine, embracing the Amalgamated, Calumet & Hecla, Senator Clark and the Rothchilds, has been finally formed.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 6, sheet 8½, bar 5½c; pig, \$5.25. London, £11 11s 3d per ton—2.51 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton = 3.55½c. cts. per lb; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$27.50; San Francisco, ton lots, 30c; 1000 lbs., 30½c; 500 lbs., 30½c; less, 31c; bar tin, \$3.35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90, \$3.10; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 15½c.

PHOSPHORUS.—F. o. b. New York 50@60c \$3.10.

ASSAY LITHARGE.—San Francisco, 10c \$3.10, small lots.

BISMUTH.—New York, \$3.10, \$2.25 50-lb. lots; San Francisco, \$2.50 to \$2.75 25-lb. lots.

PLATINUM.—San Francisco, crude, \$19 \$3.10; New York, \$20.50 per Troy oz.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

NICKEL.—New York, 50@60c \$3.10.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 9½c set; 14 oz., 40s., 8½c.

OILS.—Linsed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 31½@32½c \$3.10; carloads, 29@30c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66½ B, 2c \$3.10; soda ash, \$1.90 \$3.10 100 lbs.; hyposulphite of soda, 2½@3c \$3.10; blue vitriol, 5½@6½c \$3.10; borax, concentrated, 7@8c \$3.10; chloride of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c \$3.10; caustic soda, in drums, 3½@4c \$3.10; Cal. s. soda, bbls., \$1.00; sds, 95c \$3.10 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

SITUATIONS WANTED.

MINING ENGINEER, four years in Johns Hopkins' University, thirteen years miscellaneous work in West Virginia, desires work in the West. Address X Y Z, Mining and Scientific Press.

CYANIDE OPERATOR AND ASSAYER desires engagement. Good references. Experienced with leaching ores carrying high silver values; successful slime treatment; compressed air agitation; laboratory determinations. Address Box 78, care Mining and Scientific Press.

A Civil and Mining Engineer (member American Society of Civil Engineers, member American Institute of Mining Engineers), at present general manager of a Western gold mining company, desires change. Will go anywhere. Examining or reporting, exploration work or operating. Address Box 284, Grangeville, Idaho.

Position as Superintendent or Millman

by one experienced in wet and dry crushing cyaniding plate amalgamation assaying, and melting of bullion. References furnished. Address B, care Mining and Scientific Press.

WANTED.

WANTED.—Practical Mine Foreman for development work. New property on coast, S. E. Alaska. Must be all-round miner, tool sharpener, and perfectly sober. Go to opening for right man. Give experience, age, references, etc. Address "Foreman," care Mining and Scientific Press.

TAILINGS, SLIMES AND DUMPS WANTED.

Correspondence invited respecting Refractory Gold Ores. REX, care Mining and Scientific Press.

WANTED IMMEDIATELY. A First-Class, Reliable Carriage Blacksmith.

One thoroughly competent to take charge of a shop.

Excellent chance for the right man to better his position, if satisfactory. Answer by letter to P. C. JURS, 1119 Van Ness Ave., San Francisco.

QUICKSILVER MINE. For sale on work-tially developed, equipped quicksilver mine. Small amount of capital required to place on dividend-paying basis. Principals only. Address G. L., Mining and Scientific Press office.

NOTICE.

Notice is hereby given to all parties not to use, manufacture, permit to be used or manufactured, any device employing the process of the ROBINSON ORE CONCENTRATOR or any infringement thereon, except by legal authority.

INTERNATIONAL MINING CO.,

H. C. ROBINSON, Inventor. CANTON, O.

Direct Acting
Hoisting
Engine

BUILT FOR THE
Anaconda
Copper Mining
Company
OF MONTANA.

Embodying all that
experience and
practical working
have demonstrated
as valuable in this
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

"THE DANIEL BEST"

50 Horse Power

TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.  
Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING COMPANY,  
San Leandro, California.

# OUR PATENT WATER VAPORIZING ATTACHMENT

MEANS

A GUARANTEED SAVING OF 80 TO 90 PER CENT

of the water ordinarily used for the cooling of water jackets. It is one of the most important improvements made in smelter practice in recent years. Send for our catalogue which tells all about it and shows many different styles of Furnaces for the treatment of . . .

Gold, Silver, Lead and Copper Ores.

We design, manufacture and erect Smelters, and Mills for Concentration, Amalgamation, Chlorination and Cyanide Processes.

## Mine Timber Framing Machinery.

By the use of the above machine any ordinary mechanic, with a helper, WILL DO THE WORK OF 20 SKILLED CARPENTERS, with much more accuracy. It will make the tenons equally true on round or square timbers, and the shoulders, sides and ends of the tenons will be parallel and true.

The design of this machine is such that ALL ADJUSTMENTS CAN BE MADE WHILE THE MACHINE IS RUNNING, and, consequently, can be done in a very short space of time.

Correspondence is solicited, and prices for complete outfit will be furnished upon application.

DENVER, COLO., U. S. A.

### A Cool Roof in Hot Weather==

P & B Ready Roofing is the best roofing made, for it is a non-conductor of heat—neither contracts heat nor imparts it. Buildings covered with P & B Ready Roofing are from 3 to 30 degrees cooler than those covered with iron, tin, shingles and slate.

The hottest sun will not melt nor move P & B Ready Roofing, neither will it expand it or contract it. It is the same roof in winter or summer—always resisting heat, cold, rain, gases, fumes, acids and insects—always giving satisfaction, for it is a perfect roofing, and buildings covered with it never leak or give any trouble.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

# THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General  
Arrangement  
of  
Pelatan-Clerici  
Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by billion returns. Simplicity. Economy. Efficiency.

FOR PARTICULARS, WRITE TO

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

## SOLAR HOUSE LIGHTS

For houses not having gas or electric  
light service, and for those that have,  
but wish economy and independence.

Costs **\$4.00** Per Light  
EACH LIGHT LASTS A  
LIFETIME

Gives a steady light, brilliant as electricity,  
and whiter. Exceeds any town gas service in  
existence. No complications; nothing to get  
out of order. Simple as A, B, C. Handy as a  
"candle"—jars can be carried around anywhere  
in the house. Gas cannot escape, like from the  
town mains. No smell, no smoke and no danger,  
as with kerosene or gasoline. No accident  
of any kind possible, and the whitest, steadiest  
and richest light that is known.  
Write us for particulars.

DISTRIBUTORS TO THE TRADE:

ORE BUYERS AND EXPORTERS. - MINING SUPPLIES

**Don't Take Chances**

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

**CYANIDE WORK**

and claim to have introduced the use of Cyanide to this Western country by the

**MACARTHUR-FORREST PATENT METHODS.**

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

And in accordance with law, and an order from the Board of Directors, made on the 31st day of July, 1901, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the company, Rooms 113-114, Crocker Building, San Francisco, California, on MONDAY, the 24th day of September, 1901, at the hour of 2 o'clock P. M. of said day to pay delinquent assessments thereon, together with cost of advertising and expenses of sale.

Office--Rooms 113-114, Crocker Building, San Francisco, California.

**McGill University, Montreal.**

## CHAIR OF METALLURGY.

The Governors of McGill University invite applications for the Professorship of Metallurgy. Candidates for the appointment are requested to send their testimonials, with a statement of age, qualifications, etc., to the Secretary of the University, before September 1st. The duties of the post will commence October 1st. Full particulars of the work, salary, etc., may be obtained from the Secretary.

**The State Ore Sampling Co.**  
DENVER, COLO.

We buy Gold, Silver, Lead, Copper, Bismuth, Uranium, Wolframite, Cobalt, Molybdenite and Antimony Ores. We have modern sampling mills, also test ore for the new processes of ore reduction. Our long experience in the market enables us to obtain the highest prices for all marketable ores. Write for our "Reference Book." Send analysis of your ore for prices and information.

**BAILY & MONNIG, Managers.**

## ASSESSMENT NOTICES.

**YUBA CONSOLIDATED GOLD MINING COMPANY.**---Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of August, 1901, an assessment (No. 3) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of September, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 14th day of October, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office--Room 31, Claus Spreckels Building, San Francisco, California.

**YUBA CONSOLIDATED DRIFT MINING COMPANY.**---Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of July, 1901, an assessment (No. 3) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 214 Pine street, room 31, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24th day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office--214 Pine street, room 31, San Francisco, California.

## POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 3) has been postponed to THURSDAY, the 29th day of August, 1901, and the day of sale from the 24th day of September, 1901, to MONDAY, the 16th day of September, 1901. By order of the Board of Directors.

**THE BUTTE BASIN GRAVEL MINING COMPANY.**---Location of principal place of business, San Francisco, California; location of works, Amador County, California.

Notice is hereby given, that, at a meeting of the Board of Directors, held on the 23rd day of July, 1901, an assessment (No. 3) of One Cent per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary, at his office, 55 Steuart street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of August, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23rd day of September, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

O. E. HOLMES, Secretary.

Office--No. 55 Steuart street, San Francisco, California.

**THE CALIFORNIA DREDGING COMPANY.**---Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of August, 1901, an assessment of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, Room 56, 120 Sutter Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on TUESDAY, the 10th day of September, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of October, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

(Signed) SAM. W. CHRYNEY, Secretary.

120 Sutter Street, San Francisco, California.

## FIRTH'S DRILL STEEL. USE THE BEST.

Has no equal in Hard Rock Drilling.

ABNER DOBLE COMPANY, GEN. AGTS.,  
FREMONT AND HOWARD STS., SAN FRANCISCO.

Sold by Seattle Hardware Co., Seattle, Wash.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

## THE "WONDER" CONCENTRATOR.

PATENTED AUGUST 27, 1900.

The "Wonder" Placer Mining Machine. The machine for which the mining world has been waiting. The only Practical and Perfect Placer Machine in existence. LACK OF WATER IS NO LONGER AN OBSTACLE TO PLACER MINING. A 1-inch stream will furnish ample water for a 50-ton per hour machine. CAPACITY FROM 2 TONS TO 200 TONS PER HOUR.

The above cut gives a sectional view of the "Wonder" Placer Machine as it appears in operation.

The machine is mounted in a Portable Steel Tank, which is equipped with conveyors for feeding the ground into the machine and for removing the tailings. The tailings conveyor is equipped with our patent, endless, perforated steel buckets, which are designed to keep the tank perfectly clear of tailings all the time.

### CAPACITY.

The capacity of the "Wonder" Placer Machine is its most surprising feature. No other placer machine ever invented can approach it either as a gold saver or in handling the ground.

The actual capacity of our machines is, under favorable conditions, from  $\frac{1}{2}$  to  $\frac{1}{3}$  greater than advertised.

For handling the Tailings from Stamp Mills, or for separating the free gold from the ores pulverized by either wet or dry process, the "Wonder" Machine is without an equal.

Every practical mine operator and expert who has seen our "Wonder" machine in operation concedes that it is the greatest machine in existence.

### WHAT OTHER PEOPLE SAY.

Report from "Wonder" Concentrator being operated by Cyclone Drill Company in connection with their prospecting drill at The Mining Congress:

BOISE, IDAHO, July 24th, 1901.

GENTLEMEN:—We have the drill shipped July 1st set up and in operation on High School lot in heart of city and are attracting more attention than any other one exhibit. I came here from the South Boise ground where we have the first drill and pan sent out in operation. The drilling is very hard, but the machine is doing good work, and the pan perfect work. It saves everything. All the panning I have done after it, I have failed to find a color where the pan has been properly operated. The combination being new and the discharge from the drill very strong, some gold went over in the first two holes, but it was not fault of pan. From the holes put down after I got on the ground, the tailings do not show a color, and I panned them thoroughly.

Yours very truly,

C. W. PURSELL.

# THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

# THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

## Accounting of Mine Transportation Costs.

Directly, or indirectly, the salable metal production of a mine pays all the transportation costs that are charged against ore, fuel, supplies, mining plant, and the metal itself, from the moment the business begins by the investment of labor or capital in the mine till the metal itself by sale ceases to be production and becomes consumption. The percentage of the total sale value of the metal that this aggregate of transportation costs consumes as cost is surprisingly large. It is with difficulty realized without the making of the detailed analysis of all the cost items into which transportation enters as a sub-item.

With the industry of gold mining, separate by itself from other metal mining, the paying from the gold production of the transportation costs is clearly apprehended. With other metal mining the idea that part at least of the transportation costs is paid by the consumer would, on first statement, seem so reasonable that it would be accepted as true. An analytical consideration of the proposition, however, demonstrates that it is untrue, and that the producer pays all of the transportation costs. With silver the production pays the transportation costs, as the sale price is fixed by the general commercial trade conditions of India and China, which have absolutely nothing to do with the mining. With lead, copper and zinc the transportation costs are also paid by the production. The sale price is fixed by a combination of producers. The consumer must pay what the combination asks for these metals or do without. From the standpoint of one in the combination the freight is paid by the consumer, but the outside producer cannot so regard it. He cannot add to the other cost items the total of transportation charges and then add his profit to make a selling price. He must, if he would do business, first deduct from the selling price the transportation cost, and make the remaining costs aggregate a less sum than what remains of the selling price after the deduction.

While not the fact to say that the transportation cost is not considered by the average mine operator,

Mine Buildings and Plant at Tunnel Entrance, Red Point Mine, Placer County, Cal.

it is the fact that it is seldom taken into account at the beginning of the enterprise, and even less rarely given consideration by analysis in detail. It is the purpose of these lines to suggest to mine operators to make an analytical examination of the transportation cost their metal production is paying; and, also, where the business is yet in the projection stage, contemplated but not established, to suggest the making of an estimate of transportation cost with the same care and to the same detail that the examination of ore values is made. Some mine operators have done this, and limited as are the opportunities left by the community of interest in the transportation business for the mine business management to make economies, these operators have made economies productive of increased profit to them.

Where cost keeping has been made a part of the mine business, transportation has been carried in not more than two accounts, and sometimes in only one. In the latter case, independent of the actual incidence of the charge, whether from construction, mine operation, or ore or metal reduction, and selling, it is lumped as freight. Where two accounts are kept, one is for freight charges on everything coming to the mine; the other, on ore or metal leaving it. A third one, if kept, deals with the cost of transportation of the ore in the mine. This last has, in distinction from the others, received close attention, and economies have been successfully made by proper constructive use from the facts disclosed by the cost account. In some systems of mine accounting, freight or transportation cost is split up on the vouchers into parts, which are direct charges against other cost items in the accounts and added to these other costs, the sum only being entered. This is a closing out of the transportation costs from the accounts altogether. Also, the practice has developed, through the ore reduction works paying the charges to the carrier from the metal yield of the ore reduction, of one charge being made by the reduction works which is directly inclusive of the transportation charge and the reduction charge on the ore, and indirectly inclusive of the transportation and selling costs of the metal from the reduction works to the consumer.

With the general accounting practice directed to covering up and concealing the facts as to transportation costs, the beginning of their analysis is not a simple matter. It can only be simplified by changing the system of accounting so that the mine business accounts do show the facts. There should be no arbitrary limitation on the number of subtransportation cost accounts. Two general divisions or groups should be made. The first includes the transportation costs which are part of the investment in plant or its maintenance during its life. These are capital charges. The second includes all the transportation costs of current operation, and in keeping them there are many subdivisions that are necessary to intelligent use of the data.

## TABLE OF CONTENTS.

ILLUSTRATIONS.—Mine Buildings and Plant at Tunnel Entrance, Red Point Mine, Placer Co., Cal.; Compressed Air Locomotive, Red Point Mine, Placer Co., Cal., 84. Three Miles Underground, Red Point Mine, Placer Co., Cal., 87. The Redridge Dam, 88. McCormick Turbines Operating Electrical Machinery on Comstock Mines; Century Traveling Belt Conveyor; A New Short Beam Balance, 89. Mining and Metallurgical Patents, 90.

EDITORIAL.—Accounting of Mine Transportation Costs, 84. Gold Output of the Klondike; Misnamed Mining Stock Exchanges; Nickel Mining in the United States, 85.

MINING SUMMARY.—91-92-93-94.

LATEST MARKET REPORTS.—94.

MISCELLANEOUS.—Concentrates, 86. Compressed Air Traction Plant, Red Point Mine, Placer Co., Cal.; From Nome City, Alaska; Electric Energy from Wind 87. The Redridge Dam, 88. McCormick Turbines Operating Electrical Machinery on Comstock Mines; New System of Electric Traction; Century Traveling Belt Conveyor; A New Short Beam Balance; System of Zinc Ore Buying in Missouri; Imports of Gold at Pacific Coast Ports; Instrument for Investigating Properties of Soils, 89. Mining and Metallurgical Patents; Specimens Received by the California State Mining Bureau, May 1 to July 31, 1901, 90. Personal; Commercial Paragraphs; Recently Declared Mining Dividends; New Patents; Notices of Recent Patents, 94.

REPORTS from Dawson now indicate that the gold output of the Klondike for this season is much less than the estimates. It is doubtful if the total will exceed \$15,000,000 where not less than \$25,000,000 was looked for. In the light of the actual figures for this year it seems probable that last year was the banner year for this district. There is nothing surprising in the rapid exhaustion of the cream of the placer deposits. It has been simply another instance of what has happened in every other placer camp in the world. The cleaning up of the cream of the gold deposits does not by any means imply their exhaustion or that the Klondike is not a good country for mining any longer. As a matter of fact it is probable that the aggregate of profit over the flat cost of mining from the gold that will yet be taken out will exceed the sum already obtained as profit over the cost of production. What gold has so far been obtained has been obtained under cost conditions which are now ended. From now on economical mechanical methods and appliances for mining will come into increasing use as substitutes for the costly hand labor heretofore so largely employed. The first worked areas will be reworked for ground missed by haste and lack of knowledge of where to mine. The relatively poorer deposits that could not be worked before will now be made profit earning. The Klondike country is still good for extended placer mining for some years to come, though the period of phenomenal yield has undoubtedly passed.

THERE is a class of misnamed mining stock exchanges the establishment of which should be discouraged by any community. From the beginning they are intended, primarily, for the purpose of making what are called quotations to influence the sales of stock in localities so distant or unsuspicious that the quotation will be accepted as bona fide. A number of mines are incorporated and the promoters living in the same city establish the so-called mining exchange. At the same time their agents are out canvassing to make sales of the stock. The promoters meet every day and make wash bids and sales between themselves. These quotations are always higher. They are wired to the agents, who use them to induce investment on the theory that there is an active home market for the stocks, and that the mines must, therefore, be good. No bona fide sales are made. If the attempt is made to sell against a bid the transaction is never closed by payment of the money except under threat of a criminal prosecution. Such so-called mining stock exchanges are exceedingly harmful in their effects. They hurt the business

reputation of the community that permits them to exist, and they hamper instead of help the development of the mining industry, which directly or indirectly contributes to the support of the community. A mining exchange legitimately conducted is, on the other hand, a help both to mining development and to a community. The quotations made from actual sales mean what they say. They measure exchange market values from day to day and keep buyers and sellers in constant touch. The very freedom of exchange and the quick response in stock value that a genuine mining development gets through a legitimate exchange brings far more money into the business than would otherwise be likely to come. While investors can guess wrong in the legitimate exchange, and are compelled to pay for their guess, the game is fair—for it is possible, with even chances, to guess right. In the type of so-called exchanges first described the investor has no chance from the beginning. The so-called game is fixed in advance for the promoters, who make it to do all the winning.

## Nickel Mining in the United States.

The owners of a mine in Washington containing ores of nickel and cobalt are reported as saying that they are unable to commercially operate their mine, because the only nickel smelting and refining establishment in the United States refuses to buy or reduce their ore. The owners of the smelting plant are, however, it is further reported, willing to buy the nickel mine. The New York selling price for nickel at the present time is from 50 to 60 cents a pound, and of cobalt about \$3 a pound. There is a good commercial demand for nickel, but a comparatively small demand for cobalt.

This paper has made the statement that while custom smelters might make a mine they did not make a mining business. The instance here cited is an example that illustrates by an extreme case just what was meant by the statement. The nickel mine is made in the sense of having an ore body sufficient in quantity and sufficiently rich in commercially salable metal to pay all mining, transportation and reduction costs and leave a profit which would repay the owners for the use and risk of their capital. But the custom smelter refusing to reduce the ore there is no metal to sell and, therefore, no mining business. The same thing could be as truly said if, instead of refusing to buy or reduce the ore at all, a price had been offered, or charge made, that left to the mine owner only his flat costs of mining and transportation.

The situation for the nickel mine owners is a condition; for the owners of the smelting monopoly it is merely a point of view. The condition requires of the mine owners either (1) the sale or treatment of their ore by foreign smelters, or (2) the construction and operation of their own reduction works, or (3) selling the mine to the owners of the smelting plant at the price they are willing to pay.

The first of these carries with it such additional transportation costs that the cost of the unit of metal produced is materially increased at the expense of the margin of unit of profit. The ability of the new mine production to compete in sale price with existing production is thereby lessened and the value of the mine diminished. Further, there is no guarantee but that the nickel smelting monopoly will become inclusive of the foreign establishments.

The second involves the installation of a costly plant and a technically difficult process to operate as compared with other metal reduction plants. There is an economic minimum to the size and capacity of a plant for the reduction of nickel and cobalt ores. Below this economic minimum the unit cost of metal production would increase rapidly. The selection of the best process for the particular nickel ore is also somewhat uncertain without the guidance of comparative treatment tests under commercial conditions.

The third, selling the mine to the owners of the smelting monopoly at the latter's price, is precisely what the mine owners do not want. The possibility of such a conclusion to an investment of capital would never have induced the investment of capital. In its essence, the owners of the mine are being deprived of what is their property, by the owners of the smelting monopoly operating within the recognized limits of business and industry, exactly as if the mine owners were the men in the stagecoach and the

owners of the smelting monopoly were the men on the lonely roadside with the guns and the drop.

The situation, merely a point of view to the owners of the smelting monopoly, is this: The nickel consumed in the United States comes from the Sudbury deposits in Canada. The total of it is one-half the world's production. The smelting monopoly in the United States has a monopoly of the Sudbury nickel production in the United States. By the use of that monopoly the market price of nickel, which was 20 cents a pound in 1895 and 24 cents a pound in 1898, is now 50 cents a pound. At the same time there has been an enormous increase in consumption. The average nickel and copper content of the ores mined and reduced during this period remained constant. The smelting monopoly has successfully taken to itself all the added profit from the increased price, none of it being lost through the higher unit costs of production which would come from the extension of the mining to ores containing a less metal content. The smelting monopoly has all this existing profit and supplies the demand. It cannot be expected to desire either to divide the total of the profits or to reduce the existing unit profit. To it the new mine offering ore and not metal to the market only makes a spectacle but does not create a condition. Offering to buy the mine is a concession to a possible future condition, not demanded to satisfy the point of present view. It is not forced on the smelting monopoly to offer to buy the mine now.

The situation of the nickel mining industry in the United States is an existing example illustrative of what this paper has indicated the lead-silver mining may become. The high sale price of nickel has led to a closer prospecting for it throughout the United States. It has been found in Washington, in Oregon, at several points in Nevada, and a discovery is reported on Prince of Wales island, Alaska. Dependence on a smelting monopoly which will not reduce the ores these discoveries are commercially worthless. Dependence of the lead-silver mining on a smelting monopoly will tend to make the mine commercially less valuable. It would likely make them as commercially valueless as the nickel deposits if it had the same opportunity of which the nickel smelting monopoly has taken advantage.

There is, as well as a point of view, a point of policy for the smelter monopoly which would seem worth considering. The smelter monopoly can say to the United States nickel miner, "What are you going to do about it?" As between the smelter monopoly and the miner, the preceding shows very little for the miner to do about it, and that little very hard to do. In the end perhaps the best would prove only the obtaining of a higher price for the mines from the smelting monopoly.

But there is a third party that, in this particular case, certainly has a right to be considered, accompanied with the possession of the power to enforce it. The people of the United States, by its National Government, are the largest consumers of nickel. It is a constituent of armor plate and ordnance. The people also by the National Government own the nickel deposits in the United States. The largest single element of cost in the nickel steel armor plate is the nickel. This nickel, produced at a unit cost if anything less in 1901 than in 1895, is bought by the Government in 1901 at two and one-half times the price it paid in 1895. It would not have to continue paying this advance in price to nickel producers, least of all to foreign nickel producers, if its own deposits of nickel in the United States were mined by its own citizens.

The price paid for nickel steel armor plate has become a chronic public scandal. Suppose that, recognizing the cause of this to be largely in the cost of foreign mined nickel, Congress instead of fighting the armor plate manufacturers should offer a price for nickel mined in the United States and furnish that to the armor manufacturers, just as it now provides the armor to the builders of the warships. It might also give nickel mining the help of a duty to enable the industry to establish itself against the foreign production.

It would seem that, preferably to risking the intervention, in establishing the price of nickel, of the people who pay the price whatever it is and however fixed, the policy of the smelting monopoly should be to concede some of the present profit to miners in the United States.

## Concentrates.

THE mineral zircon is very common in occurrence. It has no commercial use or quoted sale value.

STEEL is so homogeneous in its structure that internal flaws are exceedingly uncommon. This is not the case with wrought iron, which is liable in any piece to contain a hidden flaw.

COPPER ORES have been shipped from British Columbia to Swansea, Wales, at \$5 a ton. It is stated that sulphurets in sacks from Juneau, Alaska, to Tacoma, Wash., have been carried for \$1.25 per ton.

INJUNCTIONS issued against the copper smelting works at Ducktown, Tenn., on the suits of farmers who claimed damage from sulphur fumes have been dissolved and the companies allowed to resume work pending a final decision.

MORE than two-thirds of the entire production of copper in the United States is refined electrolytically. About 16,000 electrical H. P. are consumed producing 580 tons of refined copper daily, and 51,800 ounces of silver and 491 ounces of gold are recovered as by-products.

THE United States District Court, in the suit of Joseph R. DeLamar, owner of the Waldestein patent for the precipitation of gold from cyanide solutions by zinc dust, for infringement of the patent, against the DeLamar M. Co., at Silver City, Idaho, has decided that the patent is invalid.

A DEPUTY SURVEYOR, surveying a mining claim for patent, must keep within the boundaries established by the location monuments. He is not permitted to extend the lines and establish corners outside of the location corners even if there is no conflicting claim to the additional land so included.

THE Canadian Province of Ontario has a law under which nickel ores mined pay \$10 a ton royalty or \$60 a ton on the nickel contained in them if they are partially treated or reduced, and copper-nickel ores pay \$7 a ton or \$50 a ton on the metal if partly treated or reduced. The law has not been enforced yet.

COAL is now regularly mined in the Canadian Yukon and sold at Dawson and Circle City in large quantities for fuel. A mine is operated on Cliff creek, 60 miles below Dawson, and is connected with bunkers on wharfs on the Yukon by a tram line. The seam is said to be 8 feet thick opened by four tunnels. The production in 1900 was 3000 tons.

THE nickel ores of New Caledonia as shipped from the island contain between 7% and 8% of nickel. It has been computed that the ore could be reduced at the mines and delivered at market points with cost charges against it totaling about 12 cents a pound. Ore that did not contain so large a percentage of nickel could not be reduced to metal at so low a unit cost.

A MINING LOCATION properly made as to posting of notice and marking of boundaries, but void by reason of no discovery of valuable mineral having been made, is made a valid discovery by a subsequent discovery of the valuable mineral, provided no rights of third parties have intervened. Another locator by making the discovery would be a third party whose right intervened.

A COMMON METHOD of detecting unsoundness in cement—that is, cracking or distortion under setting—is to make small cakes or pats of neat cement, about 3 or 4 inches in diameter and  $\frac{1}{2}$  inch thick in the center, thinning towards the edges, upon plates of glass, and keep them in air or water for a few days. If these pats show any signs of distortion or surface cracks, it is taken as an indication towards distortion.

THE sulphur in coal occurs both in pyrite and in organic matter. The iron occurs practically entirely as pyrite. To determine the proportions of sulphur in the two forms, calculate the quantity of sulphur necessary to satisfy the iron as pyrite. The difference between the quantity of sulphur calculated for the iron and the total quantity as shown by the proximate analysis is the amount in organic combination.

SMELTING CHARGES are based ordinarily on what are termed neutral ores—ores in which the percentages of iron and silica are about equal. Some smelters deduct 10 cents for each unit per cent of iron in excess of silica and add 10 cents for each unit of excess of silica over iron. Thus the charge for a neutral ore being \$6 a ton if it contains 10% more iron than silica, the charge would be reduced to \$5 a ton; and if it contained 10% more silica than iron, the charge would be \$7 a ton.

CHROME IRON ORE is not at present mined in California. The ore formerly mined went by sailing vessel to Baltimore, Md., and was used for the manufacture of chromium salts. It is too impure, particularly in silica, for the making of ferro-chromium in the electric furnace. The silicon is reduced and enters the alloy. When mined in California it paid nothing but wages to the men employed. Freight by rail and ocean absorbed the larger part of the sale price. Ocean freights are higher now than then.

THE sectional or public land survey plats of townships and sections give very little reliable information about the topography of the land purported to be surveyed. Much of the surveying was done by sketching the country as it appears from some high elevation in the vicinity. The topographical survey maps made by the U. S. Geologic Survey do give the topography with a high degree of accuracy. The 500-foot contours are run out

in the field and the intermediates of 100 feet are interpolated. Where the topography is flatter, the 100-foot contours are sometimes surveyed out in the field and 25-foot contours between interpolated. The plats satisfy the engineering requirements of accuracy for preliminary projections of roads and ditches. They can be bought from the director of the U. S. Geological Survey at Washington, D. C., for 5 cents a sheet. The exact sum should be remitted by postal order.

THE tempering of drill steel for any particular rock is practically a matter of cut and try—that is, keep trying different tempers until the temper is found at which the drills stand best. The hardness in the mineral scale is not by itself a sufficient guide. The cut of the drill is made by impact where the hardness in the mineral scale of hardness is determined by the effect of applying pressure. Very hard minerals are frequently very brittle and break up under impact, while some soft minerals are tough and resistant under impact.

THE cost per ton of ore mined and stamped and the cost of the copper produced for smelting and selling at the Atlantic mine, at Houghton, Mich., was \$1.78; at the Franklin mine, \$2.41; at the Osceola, \$2.28; at the Quincy, \$3.44; at the Tamarack, \$3.36; at the Wolverine, \$2.46. The cost of the copper produced, including marketing expenses, was: At the Atlantic, 14.8 cents per pound; Franklin, 17.9 cents; Osceola, 13.92 cents; Quincy, 13.63 cents; Tamarack, 11.41 cents; Wolverine, 9.67 cents. The figures are for the 1900 production.

THE cost of producing copper by the Greene Con. C. Co. at La Cananea, Sonora, Mexico, is stated officially by the company to be in detail as follows: Cost of mining, \$0.91 per ton; cost of smelting to matte, \$2.14 per ton; hauling from mines to smelter, \$0.15; total, \$3.20 per ton of ore. Production of copper per ton is 159 pounds, or \$0.0201 per pound. Freight on matte to New York \$12 a ton, \$0.012 per pound; \$5 a ton, or \$0.005 per pound, for bessemerizing; sales commission \$0.005, refining \$0.0025 a pound, making a cost charge total of \$0.0446 per pound.

STOCK in a mining corporation that is non-assessable is not any more desirable as an investment from that fact. The non-assessable provision is paid for by the owner and generally at a high rate. If the mine turns out well, the promoters who insured the non-assessable feature get the lion's share of the mine profit as pay for that insurance. If it is a failure, it is just as much a dead loss as if it were assessable, and if, as it usually happens, it requires more capital than the promoters estimated, there is no means of providing it from the existing stock ownership.

IN the construction of the Bay Counties flume line, to take water from the North Fork of the Yuba river in Yuba Co., Cal., to the power plant, the different varieties of native woods were employed as follows: All sills are made of heart cedar; posts and caps are made of heart yellow pine; bottom and side boards are made of heart sugar pine or heart yellow pine; battens are made of sugar pine and underpinning and trestle bents of heart red spruce. No sapwood is used at all. All scantlings are seasoned before using, but bottom and side boards can be laid in place green from the saw.

CONCRETE can be made successfully in very cold weather. The materials should be heated, the stone as well as the sand, cement and water. The concrete, while setting, should be protected from freezing. This is done by housing over the forms and heating by stoves. The concrete bridge piers of the Transiberian Railway, in the Transbaikalian division, were built in winter with the temperature 20° F. to 30° F. below zero, by housing in the work. In that extreme cold it was found practicable to go down through the ice of shallow streams and excavate the beds to solid foundation for the piers, without having to handle water.

THE current accepted idea regarding the frictional resistance to flow of water through bends or turns in pipe is that the frictional resistance and consequent loss of head increased rapidly with the shortening of the radius of the turn. The text-books have recommended that where it was desirable to avoid loss of pressure and flow, the bends should be made with a radius not less than five times the radius of the pipe. The correctness of the idea and the soundness of the advice are now questioned by some American engineers, who advance almost precisely the opposite, claiming that their carefully carried-out experiments show that curves of short radius show less frictional resistance to flow than curves of longer radius.

NATURAL CEMENT CONCRETE has been used for the main body or core of the mass of a structure, with a Portland cement concrete for the facing. Instances have been given, however, which indicate that it is difficult to make a thorough bond between the two classes of concrete, and that there is liable to be a line of separation between them. Natural cement may be used in foundations, etc., but for walls, or other exposed work where Portland cement is to be used, it is considered better to use this cement throughout. Economy may be effected by using a poorer mixture of concrete for the interior of the mass, rather than by using a different kind of cement.

THE degree of heat attained by drill steel in forging before tempering may or may not affect the tempering. The forging heat, if it is much higher than the temperature at which tempering begins, may, if it be reduced to the latter too rapidly, set up excessive strains in the
